operations research is a field whose major contribution has been to
propose a rigorous formulation of often ill defined problems
pertaining to the organization or the design of large scale systems
such as resource allocation problems scheduling and the like while

this effort did help a lot in understanding the nature of these problems the mathematical models have proved only partially satisfactory due to the difficulty in gathering precise data and in formulating objective functions that reflect the multi faceted notion of optimal solution according to human experts in this respect linear programming is a typical example of impressive achievement of operations research that in its deterministic form is not always adapted to real world decision making everything must be expressed in terms of linear constraints yet the coefficients that appear in these constraints may not be so well defined either because their value depends upon other parameters not accounted for in the model or because they cannot be precisely assessed and only qualitative estimates of these coefficients are available similarly the best solution to a linear programming problem may be more a matter of compromise between various criteria rather than just minimizing or maximizing a linear objective function lastly the constraints expressed by equalities or inequalities between linear expressions are often softer in reality than what their mathematical expression might let us believe and infeasibility as detected by the linear programming techniques can often be coped with by making trade offs with the real world

takes into account the effective use of human factors issues in advanced manufacturing which would make the difference between the failure or success of industrial corporations international authorities describe how to implement methods and techniques applicable on a global basis into manufacturing and process industries where change is being brought about as they move to concurrent engineering formats of operation

this reference covers all aspects of programming and customising autocad syntax example usage related functions and tips are given for each of the functions which are listed alphabetically for easier access

industrial robots are now being more readily included into highly integrated expensive manufacturing systems the development of off line teaching methods has thus become increasingly important if costly on line programming time is to be avoided this combined with the fact that the programming aspect now forms one of the major bottlenecks delaying the expansion of robot applications makes this book most timely in its attempt to offer solutions to the problem the comparison of methods and experiments contained in this volume will be of help in establishing guidelines for future industrial use of robots programming strategies are examined as are assembly applications simulation programming aids and programming for a cim environment a number of examples are included illustrating the current state of off line techniques
