this paper considers the possibility that in linear rational expectations models all determinate uniquely non explosive solutions coincide with the minimum state variable msd solution which is unique by construction in univariate specifications of the form $y_t = a_t + c_1 y_{t-1} + c_2 u_t$ that result holds if a re solution is unique and non explosive then it is the same as the msd solution also this result holds for multivariate versions if the a and c matrices commute and a certain regularity condition holds more generally however there are models of this form that possess unique non explosive solutions that differ from their msd solutions examples are provided and a strategy for easily constructing others is outlined
