this new edition provides a good exposure to the multidisciplinary nature of the subject and deals with various life supporting systems their ecological aspects and effects on the sustenance of life covering the bio geochemical cycles in

sufficient detail useful for courses taught in departments of science and environment biotechnology and chemical engineering the text presents an overview of important aspects of air and water pollution especially the effects of industrial activities on pollution chapters seven and eight which are new to this edition discuss chemical toxicology and waste management an area of great importance today

there is growing awareness of environmental pollution but the problem of abatement and control remains unsolved this is due to lack of knowledge in monitoring methodology and control measures in our teaching programmes an attempt is made in this book to fill up this gap the introductory chapter covers grim picture of pollution in india and abroad this is followed by discussion on choice of methods of monitoring and brief account of modern methods of environmental analysis the consideration of air pollution will not be complete without the knowledge of air pollution meterology and monitoring and it is covered in next few chapters the water pollution not only considers mode of analysis but also of treatment the challenging problem is posed by industrial effluent and sewage from the viewpoint of treatment and control agricultural pollution largely encompasses ill effects of pesticides which are separately discussed the solid waste hazardous waste and biomedical waste are new problems of this century an upto date account on their characteristion treatment and disposal are given next chapters noise pollution thermal pollution radiation hazards have their own role to play their abetment is must inspite of collecting large data on pollution future planning and control cannot be undertaken without the knowledge of environmental impact assessment and environmental modelling these topics are briefly covered at end of book this book should be indispensable for graduate and post graduate programmes in environmental science and engineering with due emphasis on monitoring and control adequate references are provided in each chapter and also in bibliography this will help serious workers in environmental technology practicing chemist and environmental engineers

environmental chemistry is a relatively young science interest in this subject however is growing very rapidly and although no agreement has been reached as yet about the exact content and limits of this interdisciplinary subject there appears to be increasing interest in seeing environmental topics which are based on chemistry embodied in this subject one of the first objectives of environmental chemistry must be the study of the environment and of natural chemical processes which occur in the environment a major purpose of this series on environmental chemistry therefore is to present a reasonably uniform view of various aspects of the chemistry of the environment and chemical reactions occurring in the environment the industrial activities of man have given a new dimension to environmental chemistry we have now synthesized and described over five million chemical compounds and chemical industry produces about one hundred and fifty million tons of synthetic chemicals annually we ship billions of tons of oil per year and through mining operations and other geophysical modifications large quantities of inorganic and organic materials are released from their natural deposits cities and metropolitan areas of up to 15 million inhabitants produce large quantities of waste in relatively small and confined areas much of the chemical products and waste products of modern society are released into the environment either during production storage transport use or ultimate disposal these released materials participate in natural cycles and reactions and frequently lead to interference and disturbance of natural systems

over the last 15 years the focus of chemical pollution has shifted from conventional pollutants to so called emerging or new unregulated contaminants these include pharmaceuticals and personal care products hormones uv filters perfluorinated

compounds polychlorinated flame retardants, pesticides, plasticizers, artificial sweeteners, illicit drugs and endocrine disruptor compounds. Despite the increasing number of published studies covering emerging contaminants, we know almost nothing about the effects of their transformation products and/or metabolites. This two-volume set provides a unique collection of research on transformation products, their occurrence, fate and risks in the environment. It contains 32 chapters organised into 7 parts, each with a distinct focus: general considerations, transformation processes and treatment strategies, analytical strategies, occurrence, fate and effects in the environment, global speciality and environmental status, risk assessment, management and regulatory framework, outlook. Transformation products of emerging contaminants in the environment is a valuable resource for researchers and industry professionals in environmental chemistry, analytical chemistry, ecotoxicology, environmental sciences and hydrology, as well as environmental consultants and regulatory bodies.

New edition of an undergraduate textbook introduces the basic chemical concepts underlying environmental science.

Environmental chemistry is a relatively young science. Interest in this subject, however, is growing very rapidly and although no agreement has been reached as yet about the exact content and limits of this interdisciplinary subject, there appears to be increasing interest in seeing environmental topics which are based on chemistry embodied in this subject. One of the first objectives of environmental chemistry must be the study of the environment and of natural chemical processes which occur in the environment. A major purpose of this series on environmental chemistry, therefore, is to present a reasonably uniform view of various aspects of the chemistry of the environment and chemical reactions occurring in the environment. The industrial activities of man have given a new dimension to environmental chemistry. We have now synthesized and described over five million chemical compounds and chemical industry produces about one hundred and fifty million tons of synthetic chemicals annually. We ship billions of tons of oil per year and through mining operations and other geophysical modifications, large quantities of inorganic and organic materials are released from their natural deposits. Cities and metropolitan areas of up to 15 million inhabitants produce large quantities of waste. In relatively small and confined areas, much of the chemical products and waste products of modern society are released into the environment, either during production, storage, transport, use or ultimate disposal. These released materials participate in natural cycles and reactions and frequently lead to interference and disturbance of natural systems.

this undergraduate textbook has been written for students specializing in environmental science or ecology who require an introduction to the basic chemical concepts underlying a sound understanding of the subject the aim throughout is to stress basic chemical principles starting with atomic and molecular structure and leading to more advanced areas within physical organic inorganic and analytical chemistry wherever possible principles are illustrated with examples from environmental science and the final chapter provides case studies of environmental chemical processes while the primary aim is to satisfy the needs of the nonchemist it will also be useful to chemists who wish to apply their expertise to topics within environmental science
