structure and function of membrane proteins documents the proceedings of the international symposium on structure and function of membrane proteins held in selva di fasano on may 23 26 1983 this compilation makes it possible to obtain more information on the structure of membrane proteins determining the structure in order to understand the function and mechanism of action that is only understood by knowledge of the atomic structure the gathering of data on the function of membrane proteins prior to knowledge of their structure is valuable for characterizing and defining the proteins once the structure is known another stage of research will penetrate to the functional assignments of the structure other topics covered include the physical methods for the structure function relationship identification and mapping of sites in membrane proteins and primary structure of transport proteins tertiary structure and molecular shape of membrane proteins and structure function relationship in membrane proteins are also examined this book is a good source of information for students and individuals conducting research on biochemistry specifically on membrane proteins

protein lipid interactions as a field of study is now a mature area and this volume of new comprehensive biochemistry has been published with two objectives in mind firstly to look to the future and try to envisage how the subject may develop in the near to medium future secondly to present contrasting or complementary views on the same system for example the acetylcholine receptor is discussed from a predominantly structural aspect by barrantes and from the kinetic standpoint by rankin et al the volume not only gives an update on specific aspects of the field but also shows the way in which the phenomenon of protein lipid interactions is now seemingly infiltrating many areas of biomembrane research from recombinant dna studies protein insertion and assembly and reconstitution consideration to structural studies of membrane proteins

cation flux across biomembranes documents the proceedings of a symposium on cation flux across biomembranes sponsored by the japan bioenergetics group held september 10 13 1978 at the inter university seminar house of kansai in kobe japan the symposium brought together 80 of the leading investigators concerned with atp utilizing and atp generating systems associated with cation fluxes across membranes to discuss biochemical mechanisms in depth and their relation to cation transport functions the papers presented focused on three types of membrane systems the first two membrane systems are classified as atp utilizing systems these include the plasma membrane associated with the atp dependent na k transport system which draws upon most of the cell's energy for cation fluxes and the sarcoplasmic reticulum membrane associated with ca transport which plays a key role in excitation contraction coupling in muscle the third type of membrane system falls under atp generating systems these include the inner membranes of mitochondria chloroplasts and bacteria associated with h fluxes generated by oxidation reduction reactions and their coupling to secondary ion flows and oxidative and photosynthetic phosphorylation h transport associated with the photoreaction cycle of bacteriorhodopsin the light energy converted in halobacteria was also considered

cell surface carbohydrate chemistry is a collection of papers from a symposium of the same title held in san francisco u s a on september 1 2 1976 the book discusses cell biology and carbohydrates particularly oligosaccharides that make up the glycoproteins and glycolipids in the cell membrane of normal neoplastic cells one paper discusses the involvement of membranes in the biosynthesis of glycoproteins one author also analyzes the glycoproteins from the surface of tumor cells the glycoproteins have complex saccharide structures similar to virus transformed fibroblasts or transformed epithelial cells another paper cites the concepts made by abercrombie and ambrose regarding distinct galactosyltransferase activity released by tumor cells another paper addresses a hypothetical mechanism to explain the control of cell growth by nucleoside efflux through the membrane one author analyzes the basis for the selectivity of some cancer chemotherapeutic agents these can also have an effect in the immunity responses of the host against cancer cells this book can prove useful for the medically oriented investigator the biologist and the scientist involved in molecular chemistry and cancer research

this handbook provides a thorough account of recent directions in membrane channel research each subject is covered in terms of channel biophysics pharmacology and molecular biology the introductory chapter reviews methodologies of molecular biology currently used for studying molecular structure and function of membrane channels and specific domains in channel proteins

the seventh edition of disorders of voluntary muscle has been rewritten and redesigned with the needs of the clinician and clinical scientist in mind it contains up to date information on the etiology and pathogenesis of diseases of skeletal muscles including the mitochondrial myopathies ion channel disorders muscular dystrophies and dysimmune myopathies it covers the many recently identified diseases of muscle and emphasises the progress that has been made in diagnosis and treatment as background to the clinical coverage the new edition also has chapters summarizing advances in molecular and developmental biology immunopathology mitochondrial biology ion channel dynamics cell membrane and signal transduction science and imaging technology combining essential new knowledge with the fundamentals of history taking and clinical examination this extensively illustrated book will continue to be the mainstay for practising physicians and biomedical scientists concerned with muscle disease

when the six of us gathered to start planning for what was to be the third edition of physiology of membrane disorders it was clear that since 1986 when the second edition appeared the field had experienced the dawning of a new era dominated by a change in focus from phenomenology to underlying mechanisms propelled by the power of molecular biology in 1985 detailed molecular information was available for only three membrane transporters the lac permease bacterial rhodopsin and the acetylcholine receptor during the decade that has since elapsed almost all of the major ion channels and transport proteins have been cloned sequenced mutagenized and expressed in homologous as well as heterologous cells few if any of the transporters that were identified during the previous era have escaped the probings of the new molecular technologies and in many instances considerable insight has been gained into their mechanisms of function in health and disease indeed in some instances novel unexpected transporters have emerged that have yet to have their functions identified the decision to adopt the new title molecular biology of membrane transport disorders was a natural outgrowth of these considerations
