computer algebra systems have the potential to revolutionize the teaching of and

learning of science not only can students work thorough mathematical models much more efficiently and with fewer errors than with pencil and paper they can also work with much more complex and computationally intensive models thus for example in studying the flight of a golf ball students can begin with the simple parabolic trajectory but then add the effects of lift and drag of winds and of spin not only can the program provide analytic solutions in some cases it can also produce numerical solutions and graphic displays aimed at undergraduates in their second or third year this book is filled with examples from a wide variety of disciplines including biology economics medicine engineering game theory physics chemistry the text is organized along a spiral revisiting general topics such as graphics symbolic computation and numerical simulation in greater detail and more depth at each turn of the spiral the heart of the text is a large number of computer algebra recipes these have been designed not only to provide tools for problem solving but also to stimulate the reader s imagination associated with each recipe is a scientific model or method and a story that leads the reader through steps of the recipe each section of recipes is followed by a set of problems that readers can use to check their understanding or to develop the topic further

over two hundred novel and innovative computer algebra worksheets or recipes will enable readers in engineering physics and mathematics to easily and rapidly solve and explore most problems they encounter in their mathematical physics studies while the aim of this text is to illustrate applications a brief synopsis of the fundamentals for each topic is presented the topics being organized to correlate with those found in traditional mathematical physics texts the recipes are presented in the form of stories and anecdotes a pedagogical approach that makes a mathematically challenging subject easier and more fun to learn this is a self contained and standalone text using maple that may be used in the classroom for self study as a reference or as a text for an online course

this book is written as a senior undergraduate and graduate textbook of theoretical

plasma physics topics include boltzmann equation two fluid equations magnetohydrodynamics vlasov maxwell plasma absolute and convective instabilities fundamental kinetic theory lenard balescu equation electric fluctuation plasma electrodynamics and causality nonlinear waves inverse scattering method surface waves and dusty plasma it also includes special topics like parametric instabilities and kinetic theory of surface waves in a plasma slab the development of theory is presented through gentle mathematical steps through easy and straightforward demonstration the readers will be able to appreciate the beauty of mathematical analysis in connection with theoretical plasma physics

calorimetry is used to measure the transfer and exchange of heat it is a technique that has applications in different research and industrial sectors it can be applied in kinetic studies as well as to measure physical changes of first and second order transitions such as glass transition melting and crystallization it can also be used to evaluate thermodynamic parameters this book reports on calorimetry in three sections applications in general calorimetry in materials and calorimetry in biotechnology
