the goals of data collection and its statistical treatment in the earth sciences the earth sciences are characterised by loose and complex relationships between variables and the necessity to understand the geographical distribution of observations as well as their frequency distribution our frequency distributions and the looseness of relationships reflect the complexity and intrinsic natural variation in nature more than measurement error furthermore earth scientists cannot design experiments according to statistical recommendation because the availability and complexity of data are beyond our control usually the system we are studying cannot be isolated into discrete independent variables these factors influence the first steps of research how and where to collect specimens or observations some issues are particularly troublesome and common in earth science but are rarely handled in an undergraduate statistics course these include spatial sampling methods orientation data regionalised variables time series identification of cyclicity and pattern discrimination multivariate systems lurking variables and constant sum data it is remarkable that most earth science students confront these issues without formal training or focused consideration
