energy recovery from waste resources holds a significant role in the sustainable waste management hierarchy to support the concept of circular economies and to mitigate the challenges of waste originated problems of sanitation environment and public health today waste disposal to landfills is the most widely used methodology particularly in developing countries because of limited budgets and lack of efficient infrastructure and facilities to maintain efficient and practical global standards as a consequence the dump sites or non sanitary landfills have become the significant sources of greenhouse gases emissions soil and water contamination unpleasant odors leachate and disease spreading vectors flies and rodents however waste can be utilized to produce a range of potential products such as energy fuels and value added products under waste biorefineries a holistic and quantitative view such as waste biorefinery on waste management must be linked to the actual country taking into account its socio economic situation local waste sources and composition as well as the available markets for the recovered energy and products therefore it is critical to understand that solutions cannot be just copied from one region to the others in fact all waste handling transportation and treatment can represent a burden to the cities environment and macro and micro economics except for the benefits obtained from recovered materials and energy equally significant is a clear and quantitative understanding of the industrial and public potential of utilizing recovered materials and energy in the markets as these can be reached without exacerbating the environmental issues using excessive transport the book explores new advancements and discoveries on the development of emerging waste to energy technologies practical implementation and lessons learned from sustainable wastemanagement practices under waste biorefinery concept which will accelerate the growth of circular economies in the world the articles presented in this book have been written by expert researchers and academics working in institutions at different countries across the

world including germany greece japan south korea china saudi arabia pakistan indonesia malaysia iran and india the research articles have been arranged into three main subject categories 1 resource recovery from waste 2 waste to energy technologies and 3 waste biorefineries this book will serve as an important resource for research students academics industry policy makers and government agencies working in the field of integrated waste management energy and resource recovery waste to energy technologies waste biorefineries etc the editorial team of this book is very grateful to all the authors for their excellent contributions and making the book successful

mathematicians have devised different chaotic systems that are modeled by integer or fractional order differential equations and whose mathematical models can generate chaos or hyperchaos the numerical methods to simulate those integer and fractional order chaotic systems are quite different and their exactness is responsible in the evaluation of characteristics like lyapunov exponents kaplan yorke dimension and entropy one challenge is estimating the step size to run a numerical method it can be done analyzing the eigenvalues of self excited attractors while for hidden attractors it is difficult to evaluate the equilibrium points that are required to formulate the jacobian matrices time simulation of fractional order chaotic oscillators also requires estimating a memory length to achieve exact results and it is associated to memories in hardware design in this manner simulating chaotic hyperchaotic oscillators of integer fractional order and with self excited hidden attractors is quite important to evaluate their lyapunov exponents kaplan yorke dimension and entropy further to improve the dynamics of the oscillators their main characteristics can be optimized applying metaheuristics which basically consists of varying the values of the coefficients of a mathematical model the optimized models can then be implemented using commercially available amplifiers field programmable analog arrays fpaa field programmable gate arrays fpga microcontrollers graphic processing units and even using nanometer technology of integrated circuits the book describes the application of different numerical methods to simulate integer fractional order chaotic systems these methods are used within optimization loops to maximize positive lyapunov exponents kaplan yorke dimension and entropy single and multi objective optimization approaches applying metaheuristics are described as well as their tuning techniques to generate feasible solutions that are suitable for electronic implementation the book details several applications of chaotic oscillators such as in random bit number generators cryptography secure communications robotics and internet of things
