mathematics is playing an ever more important role in the physical and biological sciences provoking a blurring of boundaries between scientific disciplines and a resurgence of interest in the modern as well as the classical techniques of applied mathematics this renewal of interest both in research and teaching has led to the establishment of the series texts in applied mathematics the development of new courses is a natural consequence of a high level of excitement on the research frontier as newer techniques such as numerical and symbolic computer systems dynamical systems and chaos mix with and reinforce the traditional methods of applied mathematics thus the purpose of this text book series is to meet the current and future needs of these advances and encourage the teaching of new courses we will publish textbooks suitable for use in advanced undergraduate and beginning graduate courses and will complement the applied mathematical sciences series which will focus on advanced textbooks and research level monographs

no applied mathematician can be properly trained without some basic understanding of numerical methods i.e. numerical analysis and no scientist and engineer should be using a package program for numerical computations without understanding the program's purpose and its limitations this book is an attempt to provide some of the required knowledge and understanding it is written in a spirit that considers numerical analysis not merely as a tool for solving applied problems but also as a challenging and rewarding part of mathematics the main goal is to provide insight into numerical analysis rather than merely to provide numerical recipes the book evolved from the courses on numerical analysis i have taught since 1971 at the university of göttingen and may be viewed as a successor of an earlier version jointly written with bruno broski in 1974 it aims at presenting the
