introduces the techniques and concepts of statistics in human and physical geography this book explains not only how to apply quantitative tools but also why and how they work it helps students gain important skills for utilizing conventional and spatial statistics in their own research as well as for critically evaluating the work of others

a practice oriented and accessible introduction to geographical statistics in the newly revised second edition of practical statistics for geographers and earth scientists distinguished researcher nigel walford delivers an authoritative and easy to follow introduction to the principles and applications of statistical analysis in a geographical context the book assists students in the development of competence in the statistical procedures necessary to conduct independent investigations field work and related geographical research projects the book explains statistical techniques relevant to geographical geospatial earth and environmental data it employs graphics and mathematical notation for maximum clarity guidance is provided on how to formulate research questions to ensure that the correct data is collected for the chosen analysis method this new edition incorporates a new section on exploratory spatial analysis and spatial statistics it also offers a thorough introduction to first principles in the statistical analysis of geographical data including discussions of the quality content collection and acquisition of geographical data in depth treatments of geographical data exploration including the taking of statistical measures or quantities as well as frequency distributions probability and hypotheses comprehensive explorations of testing times including parametric and nonparametric tests insightful discussions of relationship investigation including correlation and regression as well as the spatial aspects of geographical data perfect for undergraduates pursuing a degree in geography practical statistics for geographers and earth scientists will also be a valuable tool for students in other earth and environmental sciences

statistics courses frequently gloss over the foundations of statistical analysis and concentrate solely on method as a result students are able to perform the techniques but do not know when to utilize them or how to interpret results incorporating statistical methods designed to give geography students a solid understanding of key statistical concepts this in depth text both presents basic techniques and fully explores their meaning and importance structured for optimal classroom use the book includes helpful student exercises with answer keys four broad sections provide comprehensive coverage of descriptive statistics inferential statistics statistical relationships between two variables and modern methods of analysis

first published in 1978 for the non mathematician however even the simpler introductory books on statistics often raise considerable problems in this second edition first some attention has been given to the problem of the transformation of data in order to reinforce the appreciation of the need for normally distributed data for the use of so many techniques secondly the use of probability paper at least in simple terms has been introduced to illustrate the ways in which the labour of probability assessments can be circumvented thirdly radical changes have been made plus considerable expansion added to the theme of non parametric testing to provide a more systematic approach to what is a most important group of possible techniques for geographers fourthly change and expansion are also reflected in the sections on correlation and regression including some simple consideration of curvilinear relationships and the presentation of computational techniques more geared to the use of desk calculators rather than long hand methods finally the bibliography has also been expanded to incorporate a wider range of books on techniques and a selection of research papers using such techniques in a geographical or near geographical context

a textbook for advanced undergraduate first year graduate level courses in statistical methods in geography presents methods useful in research design hypothesis testing and analyzing spatial and functional relationships introduces basic statistical terms and techniques for displaying and describing distributions and covers a range of working methods including probability and sampling simple linear regression extensions of the simple linear model to multiple regression and its assumptions stepwise logit regression and canonical and discriminant analysis

the aims of statistics types of numerical data populations and samples probability and randomness frequency distributions measures of central tendency measures of dispersion and skewness the binomial and poisson distributions the normal and log normal distributions hypothesis testing one sample tests based on z and t interval estimation based on z and t paired sample test based on t and w two sample tests based on f t and u chi square tests the product moment coefficient of correlation the interpretation of correlation coefficients linear regression confidence limits and significance tests for sample regression lines

statistics are important tools for validating theory making predictions and engaging in policy research they help to provide informed commentary about social and environmental issues and to make the case for change knowledge of statistics is therefore a necessary skill for any student of geography or environmental science this textbook is aimed at students on a

degree course taking a module in statistics for the first time it focuses on analysing exploring and making sense of data in areas of core interest to physical and human geographers and to environmental scientists it covers the subject in a broadly conventional way from descriptive statistics through inferential statistics to relational statistics but does so with an emphasis on applied data analysis throughout

numerical data are everywhere charts and statistics appear not just in geography journals but also in the media in public policy and in business and commerce too to engage with quantitative geography we must engage with the quantitative methods used to collect analyse present and interpret these data quantitative geography the basics is the perfect introduction for undergraduates beginning any quantitative methods course written in short user friendly chapters with full colour diagrams the book guides the reader through a wide range of topics from the basic to the more advanced including statistics maths graphics models mapping and gis r closely aligned with the q step quantitative social science programme quantitative geography the basics is the ideal starting point for understanding and exploring this fundamental area of geography

the fourth edition of an introduction to statistical problem solving in geography continues its standing as the definitive introduction to statistics and quantitative analysis in geography assuming no reader background in statistics the authors lay out the proper role of statistical analysis and methods in human and physical geography they delve into the calculation of descriptive summaries and graphics to explain geographic patterns and use inferential statistics parametric and nonparametric to test for differences t tests anova relationships regression and correlation and spatial statistics point and area patterns spatial autocorrelation this edition introduces more advanced topics including logistic regression two factor anova and spatial estimation inverse distance weighting kriging many chapters also include thought provoking discussions of statistical concepts as they relate to the covid 19 pandemic maintaining an exploratory and investigative approach throughout the authors provide readers with real world geographic issues and more than 50 map examples concepts are explained clearly and narratively without oversimplification each chapter concludes with a list of major goals and objectives an epilogue offers over 150 open ended geographic situations inviting students to apply their new statistical skills to solve problems currently affecting our world

written for undergraduate geography majors and entry level graduate students with limited backgrounds in statistical analysis and methods mcgrew and monroe provide a comprehensive and understandable introduction to statistical methods in a problem solving framework engaging examples and problems are drawn from a variety of topical areas in both human and physical geography and are fully integrated into the text without compromising statistical rigor or oversimplifying the authors stress the importance of written narratives that explain each statistical technique after introducing basic statistical concepts and terminology the authors focus on nonspatial and spatial descriptive statistics they transition to inferential problem solving including probability sampling and estimation before delving deeper into inferential statistics for geographic problem solving the final chapters examine the related techniques of correlation and regression a list of major goals and objectives is included at the end of each chapter allowing students to monitor their own progress and mastery of geographic statistical materials an epilogue offering over 150 geographic situations gives students a chance to figure out which statistical technique should be used for a particular situation

interpreting economic and social data aims at rehabilitating the descriptive function of socio economic statistics bridging the gap between today s statistical theory on one hand and econometric and mathematical models of society on the other it does this by offering a deeper understanding of data and methods with surprising insights the result of the author s six decades of teaching consulting and involvement in statistical surveys the author challenges many preconceptions about aggregation time series index numbers frequency distributions regression analysis and probability nudging statistical theory in a different direction interpreting economic and social data also links statistics with other quantitative fields like accounting and geography this book is aimed at students and professors in business economics demographic and social science courses and in general at users of socio economic data requiring only an acquaintance with elementary statistical theory
