The field of cancer research has been significantly impacted by the discovery of cellular plasticity mechanisms which allow cancer cells to modify their phenotype and function. This adaptability not only influences the tumor microenvironment but is also affected by it. The ability of cancer cells to change has been linked to dormancy, tumor progression, metastasis, immune evasion, and treatment resistance. The dynamic relationship between cancer cells and normal cells within the tumor contributes to the shaping of each other, affecting treatment outcomes. Therefore, understanding the interactions between tumor cells and tumor cells that drive plasticity is crucial for addressing therapeutic resistance. This research topic aims to delve deeper into the cross talk between cancer cells and other cells within the tumor. It seeks to explore the role of cell intrinsic and cell extrinsic factors in tumor plasticity, including the patient's innate immunity, local and systemic inflammation levels, microbiome balance, and the impact of stress. The research also aims to understand the heterogeneity within tumors and across patients, as well as the adaptive changes that occur within the tumor and patient, including those resulting from cancer treatments that can contribute to cross-resistance.
