this textbook considers statistical learning applications when interest centers on the conditional distribution of the response variable given a set of predictors and when it is important to characterize how the predictors are related to the response as a first approximation this can be seen as an extension of nonparametric regression this fully revised new edition includes important developments over the past 8 years consistent with modern data analytics it emphasizes that a proper statistical learning data analysis derives from sound data collection intelligent data management appropriate statistical procedures and an accessible interpretation of results a continued emphasis on the implications for practice runs through the text among the statistical learning procedures examined are bagging random forests boosting support vector machines and neural networks response variables may be quantitative or categorical as in the first edition a unifying theme is supervised learning that can be treated as a form of regression analysis key concepts and procedures are illustrated with real applications especially those with practical implications a principal instance is the need to explicitly take into account asymmetric costs in the fitting process for example in some situations false positives may be far less costly than false negatives also provided is helpful craft lore such as not automatically ceding data analysis decisions to a fitting algorithm in many settings subject matter knowledge should trump formal fitting criteria yet another important message is to appreciate the limitation of one s data and not apply statistical learning procedures that require more than the data can provide the material is written for upper undergraduate level and graduate students in the social and life sciences and for researchers who want to apply statistical learning procedures to scientific and policy problems the author uses this book in a course on modern regression for the social behavioral and biological sciences intuitive explanations and visual representations are prominent all of the analyses included are done in `r` with code routinely provided

open publication this volume brings together contributors from cognitive psychology theoretical and applied linguistics as well as computer science in order to assess the progress made in statistical learning research and to determine future directions an important objective is to critically examine the role of statistical learning in language acquisition while most contributors agree that statistical learning plays a central role in language acquisition they have differing views this book will promote the development of the field by fostering discussion and collaborations across disciplinary boundaries
