this book is about synergy in computational intelligence ci it is a collection of chapters that covers a rich and diverse variety of computer based techniques all involving some aspect of computational intelligence but each one taking a somewhat pragmatic view many complex problems in the real world require the application of some form of what we loosely call intelligence for their solution few can be solved by the naive application of a single technique however good it is authors in this collection recognize the limitations of individual paradigms and propose some practical and novel ways in which different ci techniques can be combined with each other or with more traditional computational techniques to produce powerful problem solving environments which exhibit synergy i.e. systems in which the whole is greater than the sum of the parts computational intelligence is a relatively new term and there is some disagreement as to its precise definition some practitioners limit its scope to schemes involving evolutionary algorithms

neural networks fuzzy logic or hybrids of these for others the definition is a little more explicit and will include paradigms such as bayesian belief networks multi agent systems case based reasoning and so on generally the term has a similar meaning to the well known phrase artificial intelligence ai although ai is perceived more as a bottom up approach from which intelligent behaviour can emerge whereas it tends to be studied from the top down and derive from pondering upon the meaning of intelligence these and other key issues will be discussed in more detail in chapter 1
