the field of value alignment or more broadly machine ethics is becoming increasingly important as artificial intelligence developments accelerate by alignment we mean giving a generally intelligent software system the capability to act in ways that are beneficial or at least minimally harmful to humans there are a large number of techniques that are being experimented with but this work often fails to specify what values exactly we should be aligning when making a decision an agent is supposed to maximize the expected utility of its value function classically this has been referred to as happiness but this is just one of many things that people value in order to resolve this issue we need to determine a set of human values that represent humanity s interests although this problem might seem intractable research shows that people of various cultures and religions actually share more in common than they realize in this book we review world religions moral philosophy and evolutionary psychology to elucidate a common set of shared values we then show how these values can be used to address the alignment problem and conclude with problems and goals for future research the key audience for this book will be researchers in the field of ethics and artificial intelligence who are interested in or working on this problem these people will come from various professions and include philosophers computer programmers and psychologists as the problem itself is multi disciplinary

a radical and challenging book which argues that artificial intelligence needs a completely different set of foundations based on ecological intelligence rather than human intelligence if it is to deliver on the promise of a better world this can usher in the greatest transformation in human history an age of re integration our very existence is dependent upon our context within the earth system and so surely artificial intelligence must also be grounded within this context embracing emergence interconnectedness and real time feedback we discover many positive outcomes across the societal economic and environmental arenas and discuss how this transformation can be delivered key features identifies a key weakness in current ai thinking that threatens any hope of a better world highlights the importance of realizing that

systems theory is an essential foundation for any technology that hopes to positively transform our world emphasizes the need for a radical new approach to ai based on ecological systems explains why ecosystem intelligence not human intelligence offers the best framework for ai examines how this new approach will impact on the three arenas of society environment and economics ushering in a new age of re integration

this report assesses the tradecraft of intelligence analysis across the main u s intelligence agencies such as the central intelligence agency and the national security agency and recommends improvements the report makes a number of recommendations for improving analysis for a world of threats very different from that of the cold war it focuses on the two essentials of analysis first people second the tools they have available the december 2004 intelligence reform legislation set in motion initiatives that move in the right direction the creation of a deputy director of national intelligence for analysis will provide a real hub for developing tradecraft and tools and for framing critical tradeoffs the establishment of a national intelligence university will provide a focal point for training in analysis the creation of a national counterterrorism center will shift intelligence analysis toward problems or issues not agencies or sources the building of a long term analysis unit at the national intelligence council can lead away from the prevailing dominance of current intelligence and the formation of an open source center can create a seed bed for making more creative use of open source materials these specific initiatives are promising but they are just the beginnings for all the language about the importance of intelligence analysis data sharing fusion and the like the national and intelligence community leadership today devalues intelligence analysis a fundamental change is also needed in attitudes and existing organizational cultures

book of readings collected by cd founders of emotional intelligence introduces theory measurement applications of

evolutionary psychology and behavioural genetics are two successful and important fields in the study of human behaviour but practitioners in these subjects have different conceptions

of the nature of human intelligence evolutionary psychologists dispute the existence of general intelligence and emphasise the differences among species they argue that natural and sexual selection would be expected to produce intelligences that are specialised for particular domains as encountered by particular species behavioural geneticists consider general intelligence to be the most fundamental aspect of intelligence and concentrate on the differences between individuals of the same species this exciting book features papers and discussion contributions from leading behavioural geneticists evolutionary psychologists and experts on intelligence that explore the differences and the tensions between these two approaches the nature of g or general intelligence is discussed in detail as is the issue of the heritability of intelligence the alternative approaches that emphasise domain specific intelligences are explored alongside wide ranging discussions on a broad range of issues such as the biological basis for intelligence animal models and changes in iq scores over time

what is meant by the term intelligence and once defined how do we go about achieving a valid measurement of this faculty this classic textbook originally published in 1979 and now reissued with a new preface by sybil eysenck incorporates a broad range of findings and reanalyzes much of the existing literature in this area in the structure and measurement of intelligence hans eysenck draws on methods for determining the effect of genetics and environment on the development of intelligence and examines the validity of the term as defined in relation to internal as well as external criteria he tests a number of hypotheses on intelligence against empirical research findings and considers various criticisms in detail the significance of intelligence and its measurement in society are explored in depth eysenck greatly expands upon such questions as does iq measure intelligence how valid is the nature versus nurture argument and how might socioeconomic status influence one's intelligence designed primarily for students and scholars in psychology and education this text will make thought provoking reading for all concerned with the development and measurement of intelligence in the individual

what is intelligence may seem like a simple question to answer but the study and measurement of human intelligence is one of the most controversial subjects in psychology for much of its history the focus has been on differences between people on what it means for one person to be more intelligent than another and how such differences might have arisen obscuring efforts to understand the general nature of intelligence these are obviously fundamental questions still widely debated and misunderstood new definitions of intelligence and new factors affecting intelligence are frequently being described while psychometric testing is applied in most large industries iq and human intelligence provides a clear authoritative overview of the main issues surrounding this fascinating area including the modern development of iq tests the heritability of intelligence theories of intelligence environmental effects on iq factor analysis relationship of cognitive psychology to measuring iq and intelligence in the social context the clear accessible style and numerous explanatory boxes make this the ideal text for advanced undergraduate and graduate students in psychology

numerous functions cognitive skills and behaviors are associated with intelligence yet decades of research has yielded little consensus on its definition emerging from often conflicting studies is the provocative idea that intelligence evolved as an adaptation humans needed to keep up with and survive in challenging new environments the handbook of intelligence addresses a broad range of issues relating to our cognitive and linguistic past it is the first full length volume to place intelligence in an evolutionary cultural framework tracing the development of the human mind exploring differences between humans and other primates and addressing human thinking and reasoning about its own intelligence and its uses the works of pioneering thinkers from plato to darwin binet to piaget luria to weachsler are referenced to illustrate major events in the evolution of theories of intelligence leading to the current era of multiple intelligences and special education programs in addition it examines evolutionary concepts in areas as diverse as creativity culture neurocognition emotional intelligence and assessment featured topics include the evolution of the human brain from matter to mind social competition and the evolution of fluid intelligence multiple intelligences in the new age of thinking intelligence as a malleable construct from traditional iq to second generation intelligence tests the evolution of intelligence including implications for educational programming and policy the handbook of intelligence is an essential resource for researchers graduate students clinicians and professionals in developmental psychology assessment testing and evaluation language philosophy personality and social psychology sociology and developmental biology
