Foundation Engineering economy is the systematic evaluation of the economic merits of proposed engineering projects systems or alternatives It bridges the gap between engineering and finance helping engineers make informed decisions based on economic principles Sullivans 16th edition provides a robust framework for this analysis focusing on Time Value of Money TVM This fundamental concept acknowledges that money available today is worth more than the same amount in the future due to its potential earning capacity The book meticulously explains various TVM techniques including Simple Interest Interest calculated only on the principal amount Compound Interest Interest calculated on both the principal and accumulated interest This is the most prevalent method used in engineering economy Present Worth Analysis Determining the current value of future cash flows Future Worth Analysis Determining the future value of current cash flows Annual Worth Analysis Converting all cash flows to an equivalent annual value Rate of Return Analysis Determining the percentage return on investment Economic Analysis Techniques The book covers various methods for evaluating projects including Present Worth PW Method Comparing the present worth of all costs and benefits Future Worth FW Method Comparing the future worth of all costs and benefits Annual Worth AW Method Comparing the equivalent annual costs and benefits Rate of Return ROR Method Determining the rate of return of an investment 2 BenefitCost Ratio BC Method Comparing the ratio of benefits to costs Incremental Analysis Comparing the differences between two or more alternatives II StepbyStep Guide to Solving Engineering Economy Problems 1 Define the Problem Clearly identify the objective and the alternatives being considered 2 Gather Data Collect all relevant financial information including initial investment operating costs revenues salvage values and the useful life of the assets 3 Select an Analysis Method Choose the appropriate method based on the problem statement and the information available 4 Perform Calculations Use appropriate formulas and techniques as described in the book to determine the economic measures of each alternative Use spreadsheets or financial calculators to simplify calculations 5 Compare Alternatives Compare the results of the analysis and select the best alternative based on the chosen decision criterion eg highest PW highest ROR highest BC ratio 6 Consider NonEconomic Factors While the book heavily emphasizes economic factors remember that noneconomic factors safety environmental impact social responsibility should also be considered 7 Document the Decision Clearly document your assumptions calculations and the rationale behind your chosen alternative III Best Practices and Common Pitfalls Accurate Data Ensure the accuracy of all input data Errors in data can lead to incorrect conclusions Consistent Units Maintain consistency in units throughout the analysis eg dollars years Realistic Assumptions Use realistic assumptions about the future including inflation interest rates and operating costs Sensitivity Analysis Perform sensitivity analysis to test the robustness of your results to changes in key input variables Consider Inflation Account for inflation when dealing with longterm projects Sullivans book extensively covers inflation adjustment techniques Depreciation Properly account for depreciation of assets The book details various depreciation methods Taxes Include taxes in your analysis especially for larger projects Ignoring Intangibles Avoid solely focusing on financial aspects Consider qualitative factors like employee morale and environmental impacts IV Examples 3 Example 1 Present Worth Analysis A company needs to choose between two machines Machine A costs 10000 and has annual operating costs of 1000 for 5 years Machine B costs 15000 and has annual operating costs of 500 for 5 years Assume an interest rate of 10 Using present worth analysis which machine is better Solution requires using present worth formulas from the book discounting future costs to present values Example 2 Rate of Return Analysis An investment project requires an initial investment of 20000 and generates annual net cash flows of 5000 for 5 years What is the rate of return on this investment Solution involves iterative methods or financial calculators to find the discount rate that equates the present worth of cash inflows and outflows V Engineering Economy as
