this book seeks to extend the boundaries of aviation psychology in two interrelated ways by broadening the focus of aviation psychology beyond the flight deck to the whole aviation system and by discussing new theoretical developments which are shaping this applied discipline a key feature of these theoretical advances is that they are grounded in a more developed

ecologically valid understanding of practice among the issues addressed in this new integration of theory and practice are the following what goes on in the flight deck is dependent on the wider organisational context human factors issues in aircraft maintenance and grounding are critical to aviation safety our capacity to learn from aviation accidents and incidents needs to be supported by more systematic human factors investigation and research we must also develop our understanding of the human factors of accident survival as well as accident prevention theories of crew coordination and decision making must be supported by an analysis of how decisions are actually made in the real world with all its stresses and constraints training should be grounded in a thoroughgoing analysis of the complexity of the job and a full understanding of the training process itself the text will be of interest to human factors researchers and practitioners in aviation and related areas it will be of particular relevance to those who have a role in training management or regulation throughout the aviation system

the investigation and modelling of aviation accident causation is dominated by linear models aviation is however a complex system and as such suffers from being artificially manipulated into non complex models and methods this book addresses this issue by developing a new approach to investigating aviation accident causation through information networks these networks centralise communication and the flow of information as key indicators of a system s health and risk this holistic approach focuses on the system environment the activity that takes place within it the strategies used to conduct this activity the way in which the constituent parts of the system both human and non human interact and the behaviour required each stage of this book identifies and expands upon the potential of the information network approach maintaining firm focus on the overall health of a system the book s new model offers many potential developments and some key areas are studied in this research through the centralisation of barriers and information nodes the method can be applied to almost any situation the application of bayesian mathematics to historical data populations provides scope for studying error migration and barrier manipulation the book also provides application of these predictions to a flight simulator study for the purposes of validation beyond this it also discusses the applicability of the approach to industry through working with a legacy airline the methods discussed are used as the basis for a new and prospective safety management system
