view showing that multiple molecular pathways must be affected for cancer to develop but with different specific proteins in each pathway mutated or differentially expressed in a given tumor the cancer genome atlas research network 2008 parsons et al 2008 different studies demonstrated that while widespread mutations exist in cancer not all mutations drive cancer development lin et al 2007 this suggests a need

to target only a deleterious subset of aberrant proteins since any treatment must aim to improve health to justify its potential side effects treatment for cancer must become highly individualized focusing on the specific aberrant driver proteins in an individual this drives a need for informatics in cancer far beyond the need in other diseases for instance routine treatment with statins has become widespread for minimizing heart disease with most patients responding to standard doses wilt et al 2004 in contrast standard treatment for cancer must become tailored to the molecular phenotype of an individual tumor with each patient receiving a different combination of therapeutics aimed at the specific aberrant proteins driving the cancer tracking the aberrations that drive cancers identifying biomarkers unique to each individual for molecular level diagnosis and treatment response monitoring adverse events and complex dosing schedules and providing annotated molecular data for ongoing research to improve treatments comprise a major biomedical informatics need

a fundamental challenge for medical informatics is to develop and apply better ways of understanding how information technologies and methods can help support the best care for every patient every day given available medical knowledge and resources in order to provide the most effective healthcare possible the activities of teams of health professionals have to be coordinated through well designed processes centered on the needs of patients for information systems to be accepted and used in such an environment they must balance standardization based on shared

medical knowledge with the flexibility required for customization to the individual patient developing innovative approaches to design and build evidence based careflow management systems is essential for providing the knowledge management infrastructure of health care organizations that seeks to increase performance in delivering high quality care services by efficiently exploiting available resources parallel challenges arise in the organization of research at the biological and clinical levels where the focus on systematically organizing and supporting processes of scientific inquiry by novel informatics methods and databases are in their very early stages these proceedings of medinfo 2004 demonstrate the base of knowledge medical informatics professionals will collectively draw upon in the years ahead to meet these challenges and realize opportunities
