description lectures on fourier series is a comprehensive lecture based textbook that guides readers from

the fundamentals of trigonometric polynomials to the advanced applications of fourier analysis designed for advanced undergraduates engineering students and early graduate learners this book blends mathematical rigor with conceptual clarity across ten carefully structured lectures readers explore the theory computation and applications of fourier series from orthogonality and convergence to half range expansions complex representations and their role in solving heat and wave equations each lecture combines theory worked examples and practice problems culminating in a comprehensive formula sheet and mcq review section for self assessment the book emphasizes intuition mathematical precision and physical interpretation making it ideal for students of mathematics physics and engineering as well as educators and exam aspirants seeking a clear modern approach to harmonic analysis key features structured as a sequence of 10 in depth lectures for modular or sequential study covers trigonometric and complex fourier series convergence theorems and applications includes step by step derivations solved examples and problem sets features a comprehensive formula sheet and concept check questions connects classical analysis with modern signal and system theory whether you are exploring the mathematical beauty of periodic functions or the analytical power of spectral methods lectures on fourier series offers a complete and elegant journey through one of mathematics most profound tools

surfaces are among the most common and easily visualized mathematical objects and their study brings into focus fundamental ideas concepts and methods from geometry topology complex analysis morse theory and group theory at the same time many of those notions appear in a technically simpler and more graphic form than in their general natural settings the first primarily expository chapter introduces many of the principal actors the round sphere flat torus mobius strip klein bottle elliptic plane etc as well as various methods of describing surfaces beginning with the traditional representation by equations in three dimensional space proceeding to parametric representation and also introducing the less intuitive but central for our purposes representation as factor spaces it concludes with a preliminary discussion of the metric geometry of surfaces and the associated isometry groups subsequent chapters introduce fundamental mathematical structures topological combinatorial piecewise linear smooth riemannian metric and complex in the specific context of surfaces the focal point of the book is the euler characteristic which appears in many different guises and ties together concepts from combinatorics algebraic topology morse theory ordinary differential equations and riemannian geometry the repeated appearance of the euler characteristic provides both a unifying theme and a powerful illustration of the notion of an invariant in all those theories the assumed background is the standard calculus sequence some linear algebra and rudiments of ode and real analysis all notions are introduced and discussed and virtually all results proved based on this background this book is a result of the mass course in geometry in the fall semester of 2007

in three comprehensive volumes logic of the future presents a full panorama of charles s peirce s

important late writings among the most influential american thinkers peirce took his existential graphs to be his greatest contribution to human thought the manuscripts from 1895 1913 most of which are published here for the first time testify the richness and open endedness of his theory of logic and its applications they also invite us to reconsider our ordinary conceptions of reasoning as well as the conventional stories told about the evolution of modern logic this second volume collects peirce s writings on existential graphs related to his lowell lectures of 1903 the annus mirabilis of his that became decisive in the development of the mature theory of the graphical method of logic

this volume is the collected and extended notes from the lectures on hamiltonian dynamical systems and their applications that were given at the nato advanced study institute in montreal in 2007 many aspects of the modern theory of the subject were covered at this event including low dimensional problems applications are also presented to several important areas of research including problems in classical mechanics continuum mechanics and partial differential equations
