evolutionary psychology a critical introduction according to evolutionary biologists we are the minders of our genes but as christopher badcock points out in this book it is only recently that evolutionists have realized that minders need minds and that evolution needs psychology to fill the yawning gap between genes and behaviour evolutionary psychology assumes no prior knowledge of the subject and concentrates on the fundamental issues raised by the application of modern darwinism to psychology basic concepts of evolution are explained carefully so that the reader has a sound grasp of them before their often controversial application to psychology is discussed the approach is a critical one and the author does not hide the many difficulties that evolutionary psychology raises examples include the strange neglect of darwin's own writings on psychology and the fact that no existing theory has succeeded in explaining why the human brain evolved in the first place the book is the first to give a non technical account of remarkable new findings about the roles that conflicting genes play in building different parts of the brain it is also the first to consider the consequences of this for controversies like those over nature nurture iq brain lateralization and consciousness evolutionary psychology is based on many years experience of teaching evolution and psychology to social science students and is intended for all who wish to get to grips with the basic issues of one of the most exciting and rapidly growing areas of modern science

was human nature designed by natural selection in the pleistocene epoch the dominant view in evolutionary psychology holds that it was that our psychological adaptations were designed tens of thousands of years ago to solve problems faced by our hunter gatherer ancestors in this provocative and lively book david buller examines in detail the major claims of evolutionary psychology the paradigm popularized by steven pinker in the blank slate and by david buss in the evolution of desire and rejects them all this does not mean that we cannot apply evolutionary theory to human psychology says buller but that the conventional wisdom in evolutionary psychology is misguided evolutionary psychology employs a kind of reverse engineering to explain the evolved design of the mind figuring out the adaptive problems our ancestors faced and then inferring the psychological adaptations that evolved to solve them in the carefully argued central chapters of adapting minds buller scrutinizes several of evolutionary psychology's most highly publicized discoveries including discriminative parental solicitude the idea that stepparents abuse their stepchildren at a higher rate than genetic parents abuse their biological children drawing on a wide range of empirical research including his own large scale study of child abuse he shows that none is actually supported by the evidence buller argues that our minds are not adapted to the pleistocene but like the immune system are continually adapting over both evolutionary time and individual lifetimes we must move beyond the reigning orthodoxy of evolutionary psychology to reach an accurate understanding of how human psychology is influenced by evolution when we do buller claims we will abandon not only the quest

for human nature but the very idea of human nature itself
