the volume comprises five extended surveys on the recent theory of viscosity solutions of fully nonlinear partial differential equations and some of its most relevant applications to optimal control theory for deterministic and stochastic systems front propagation geometric motions and mathematical finance the volume forms a state of the art reference on the subject of viscosity solutions and the authors are among the most prominent specialists potential readers are researchers in nonlinear pde s systems theory stochastic processes

the introduction of the thesis consists of four parts first we motivate our chosen macroeconomic setting by looking at some real world phenomena for a better understanding of these phenomena we argue that the mutual dynamic interactions between flscal policy and financial markets need to be closely examined in a macroeconomic framework second we review different strands of the economic literature in order to show that most of the literature has so far exclusively concentrated either on fnancial market dynamics or on flscal policy issues we conclude that a more integrated model setting is called for in order to explain the dynamic interactions observed in reality third we discuss at

length the economic assumptions underlying our model this avoids multiple repetition later on finally we outline the structure of the thesis and the objectives we pursue in the different chapters 1 1 motivation fiscal policy and financial market reactions are increasingly receiving world wide attention the most recent examples are the maastricht criteria about flscal control the south east asia financial crisis and the resulting imf policy stance the high level of public debt in developed and developing countries and the effect on interest rates and economic growth in contrast to the still underdeveloped theoretical literature on these dynamic links finding empirical evidence that supports the existence of these links is not a very hard task
