a bestseller in its french edition this book is original in its construction and its success in the french market demonstrates its appeal it is based on three principles 1 an organization of the chapters by families of algorithms exhaustive search divide and conquer etc on the contrary there is no chapter devoted only to a systematic exposure of say algorithms on strings some of these will be found in different chapters 2 for each family of algorithms an introduction is given to the mathematical principles and the issues of a rigorous design with one or two pedagogical examples 3 for the most part the book details 150 problems spanning seven families of algorithms for each problem a precise and progressive statement is given more importantly a complete solution is detailed with

respect to the design principles that have been presented often some classical errors are pointed out roughly speaking two thirds of the book is devoted to the detailed rational construction of the solutions

research on social networks has exploded over the last decade to a large extent this has been fueled by the spectacular growth of social media and online social networking sites which continue growing at a very fast pace as well as by the increasing availability of very large social network datasets for purposes of research a rich body of this research has been devoted to the analysis of the propagation of information influence innovations infections practices and customs through networks can we build models to explain the way these propagations occur how can we validate our models against any available real datasets consisting of a social network and propagation traces that occurred in the past these are just some questions studied by researchers in this area information propagation models find applications in viral marketing outbreak detection finding key blog posts to read in order to catch important stories finding leaders or trendsetters information feed ranking etc a number of algorithmic problems arising in these applications have been abstracted and studied extensively by researchers under the garb of influence maximization this book

starts with a detailed description of well established diffusion models including the independent cascade model and the linear threshold model that have been successful at explaining propagation phenomena we describe their properties as well as numerous extensions to them introducing aspects such as competition budget and time criticality among many others we delve deep into the key problem of influence maximization which selects key individuals to activate in order to influence a large fraction of a network influence maximization in classic diffusion models including both the independent cascade and the linear threshold models is computationally intractable more precisely  $p$  hard and we describe several approximation algorithms and scalable heuristics that have been proposed in the literature finally we also deal with key issues that need to be tackled in order to turn this research into practice such as learning the strength with which individuals in a network influence each other as well as the practical aspects of this research including the availability of datasets and software tools for facilitating research we conclude with a discussion of various research problems that remain open both from a technical perspective and from the viewpoint of transferring the results of research into industry strength applications

are all film stars linked to kevin bacon why do the stock markets rise and fall sharply on the strength of a vague rumour how does gossip spread so quickly are we all related through six degrees of separation there is a growing awareness of the complex networks that pervade modern society we see them in the rapid growth of the internet the ease of global communication the swift spread of news and information and in the way epidemics and financial crises develop with startling speed and intensity

this introductory book on the new science of networks takes an interdisciplinary approach using economics sociology computing information science and applied mathematics to address fundamental questions about the links that connect us and the ways that our decisions can have consequences for others

this book presents a peer reviewed selection of extended versions of ten original papers that were presented at the 15th international symposium on computers in education siie 2013 held in viseu portugal the book provide a representative view of current information and communications technology ict educational research approaches in the ibero american context as well as internationally it includes studies that range from elementary to higher education from traditional to distance learning settings it considers special needs and other inclusive issues across a range of disciplines using multiple and diverse perspectives and technologies to furnish detailed information on the latest trends in ict and education globally design development and evaluation of educational software ict use and evaluation methodologies social web and collaborative systems and learning communities are some of the topics covered

in applications as diverse as data placement in peer to peer systems control of epidemic outbreaks and routing in sensor networks the fundamental questions can be abstracted as problems in combinatorial optimization however many of these problems are np hard which makes it unlikely that exact polynomial time algorithms for them exist approximation algorithms are designed to circumvent this difficulty by finding provably near optimal solutions in polynomial time this thesis introduces a number of new combinatorial optimization problems that arise from various applications and proposes approximation algorithms for them these problems fall into two general areas graph partitioning and facility location the first problem that we introduce is the unbalanced graph cut problem here the goal is to find a graph cut minimizing the size of one of the sides while also respecting an upper bound on the number of edges cut we develop two bicriteria approximation algorithms for this problem using the technique of lagrangian relaxation and a different algorithm for its maximization version the other graph partitioning problem that we introduce and study is the min max multiway cut problem it aims to partition a graph into multiple components minimizing the maximum number of edges coming out of any component we present an approximation algorithm for this problem which uses unbalanced cuts as well as the greedy technique in the second part of the thesis we study two generalizations of the facility

location problem which aims to open facilities assigning clients to them in order to minimize the facility opening costs and the connection costs in the facility location with hierarchical facility costs problem the facility costs are more general and depend on the set of assigned clients our algorithm based on the local search technique uses two new local improvement operations achieving a constant factor approximation guarantee the second generalization is the load balanced facility location problem which specifies a lower bound for the number of clients assigned to an open facility we give the first true constant factor approximation algorithm which uses a reduction to the capacitated facility location problem the thesis is concluded with related open problems and directions for future research abstract

this book constitutes the refereed proceedings of the 16th annual european symposium on algorithms esa 2008 held in karlsruhe germany in september 2008 in the context of the combined conference algo 2008 the 67 revised full papers presented together with 2 invited lectures were carefully reviewed and selected 51 papers out of 147 submissions for the design and analysis track and 16 out of 53 submissions in the engineering and applications track the papers address all current subjects in algorithmics reaching from design and analysis issues of algorithms over to real world applications and engineering of algorithms in various fields special focus is given to mathematical programming and operations research including combinatorial optimization integer programming polyhedral combinatorics and network optimization
