Understanding the Fundamentals

Face Detection

This technology focuses on identifying the presence of a face within an image or video It acts as the first step marking the boundaries of a face before any further analysis

Face Recognition

This goes beyond simply identifying a face It aims to match a detected face against a database of known faces aiming to identify the individual

How It Works A Technical Glimpse

Both face detection and recognition rely on advanced computer vision algorithms that analyze image data Heres a simplified breakdown of the process

Image Acquisition

The process begins with capturing an image or video frame

Preprocessing

The image is cleaned and prepared for analysis removing noise and adjusting contrast

Feature Extraction

Algorithms analyze the image identifying key features like the shape of eyes nose and mouth This creates a unique faceprint

Matching for face recognition

The extracted features are compared against a database of known faceprints to identify a match

Different Approaches From Traditional Methods to Deep Learning

Traditional Methods

Early approaches relied on handcrafted features and rulebased 2 methods focusing on specific features like edge detection

Machine Learning ML

With the rise of ML algorithms were trained on large datasets of labeled images to learn how to identify
