the most important factor affecting student learning isn't standards textbooks or testing it's teachers and when it comes to improving learning research has shown teachers what works but the real challenge comes when it's time to do what works and do it well in this book jane e pollock explains how making the right adjustments in four critical areas of practice curriculum instruction assessment and feedback can help any teacher improve student learning significantly here you'll find out how to create a classroom curriculum document that's truly useful and incorporates robust concepts generalizations and procedures plan instruction that's

focused on helping students become master learners who can apply information and skills not just do schoolwork design varied classroom assessments that yield evidence of mastery and pinpoint where further instruction is required use criterion based feedback to improve individual student achievement and refine instruction along with step by step procedures practical guidelines and specific models this book features the voices of individual teachers who share their experience using the author s big four approach like them you may find it s the missing link you need to transform your pedagogy and achieve unprecedented levels of both student success and professional satisfaction

this volume contains the proceedings of the third international conference on navier stokes equations and related nonlinear problems the conference was held in funchal madeira portugal on may 21 27 1994 in addition to the editor the organizers were carlos albuquerque fc university of lisbon casimiro silva university of madeira and juha videman 1st technical university of lisbon this meeting following two other successful events of similar type held in thurnau germany in 1992 and in cento italy in 1993 brought together to the majestically beautiful island of madeira more than 60 specialists from all around the world of which about two thirds were invited lecturers the main interest of the meeting was focused on the mathematical analysis of nonlinear phenomena in fluid mechanics during the conference we noticed that this area seems to provide today more than ever challenging and increasingly important problems motivating the research of both theoretical and numerical analysts this volume collects 32 articles selected from the invited lectures and contributed papers given during the conference the main topics covered include flows in unbounded domains flows in bounded domains compressible fluids free boundary problems non newtonian fluids related problems and numerical approximations the contributions present original results or new surveys on recent developments giving directions for future research i express my gratitude to all the authors and i am glad to recognize the scientific level and the actual interest of the articles

this book is the result of years of close observation and analysis of dongolese conversations and is a monumental and authoritative work

this book is the result of several years of research into the modeling and algorithm of problems in dynamic travel choice and related areas three types of discrete time dynamic travel choice models along with numerical examples are presented i e deterministic stochastic and fuzzy models the notable features pertaining to these models are as follows 1 the asymmetric property of the dynamic link travel time function is clearly verified which leads to a variational inequality formulation 2 the flow propagation constraint is implicitly defined in our model through the incidence

relationship between the link inflow and route flow 3 the inflow exit flow and number of vehicles on a link are identified as the three different states over time for the same vehicles under the flow propagation process therefore only one link variable needs to be used in our dynamic travel choice models this treatment can largely simplify the models complexity and possibly reduce the computation time 4 the developed time space network is consistent with scaling units both in temporal and spatial dimensions 5 the proposed nested diagonalization method takes care of two types of link interactions i e actual link travel times and inflows other than that on the subject time space link 6 the equivalence analysis between a dynamic travel choice model and its corresponding equilibrium condition is performed by proving both the necessary and sufficient conditions under the presumption of equilibrated actual travel times

the first international conference on semigroups and its related topics held in kunming china 1995 celebrated the establishment of the institute of pure mathematics at yunnan university kunming the event attracted mathematicians from around the world who contributed talks and papers on the new developments of semigroups and its applications these included topics on algebraic semigroups combinatorial semigroups computer languages codings and universal algebras since the conference the papers have been re edited and in some cases revised and are now cumulated into this review volume making it a lasting reference book on the development of semigroup theory some survey articles written by experts in the field and which were not presented at the conference are also included in this book

this volume presents different facets of soft computing which has become a new trend in integrating the fuzzy logic neural network genetic algorithm rough sets computational intelligence and related research areas theoretical development as well as industrial applications are illustrated to provide a global picture of soft computing
