nanotube superfiber materials science manufacturing commercialization second edition helps engineers and entrepreneurs understand the science behind the unique properties of nanotube fiber materials how to efficiency and safely produce them and how to transition them into commercial products each chapter gives an account of the basic science manufacturing properties and commercial potential of a specific nanotube material form and its application new discoveries and technologies are explained along with experiences in handing off the improved materials to industry this book spans nano science nano manufacturing and the commercialization of nanotube superfiber materials as such it opens up the vast commercial potential of nanotube superfiber materials applications for nanotube superfiber materials cut across most of the fields of engineering including spacecraft automobiles drones hyperloop tracks water and air filters infrastructure wind energy composites and medicine where nanotube materials enable development of tiny machines that can work inside our bodies to diagnose and treat disease provides up to date information on the applications of nanotube fiber materials explores both the manufacturing and commercialization of nanotube superfibers sets out the processes for producing macro scale materials from carbon nanotubes describes the unique properties of these materials

this addition to the isor series introduces complementarity models in a straightforward and approachable manner and uses them to carry out an in depth analysis of energy markets including formulation issues and solution techniques in a nutshell complementarity models generalize a optimization problems via their karush kuhn tucker conditions b on cooperative games in which each player may be solving a separate but related optimization problem with potentially overall system constraints e

g market clearing conditions c conomic and engineering problems that aren t specifically derived from optimization problems e g spatial price equilibria d problems in which both primal and dual variables prices appear in the original formulation e g the national energy modeling system nems or its precursor pies as such complementarity models are a very general and flexible modeling format a natural question is why concentrate on energy markets for this complementarity approach s it turns out energy or other markets that have game theoretic aspects are best modeled by complementarity problems the reason is that the traditional perfect competition approach no longer applies due to deregulation and restructuring of these markets and thus the corresponding optimization problems may no longer hold also in some instances it is important in the original model formulation to involve both primal variables e g production as well as dual variables e g market prices for public and private sector energy planning traditional optimization problems can not directly handle this mixing of primal and dual variables but complementarity models can and this makes them all that more effective for decision makers
