this volume reviews the physics studied at the cern proton antiproton collider during  
 its first phase of operation from the first physics run in 1981 to the last one at the end  
 of 1985 the volume consists of a series of review articles written by physicists who are  
 actively involved with the collider research program the first article describes the  
 proton antiproton collider facility itself including the antiproton source and its  
 principle of operation based on stochastic cooling the subsequent six articles deal  
 with the various physics subjects studied at the collider each article describes in detail  
 the experimental results on a particular subject and also provides the theoretical  
 framework necessary for their interpretation finally the last two articles discuss the  
 physics expectations from the improved collider the so called acol program which

has just started operation and also from the next generation of supercolliders which are being considered both in europe and in the united states america
