present the five major ideas of category theory categories functors natural transformations universality and adjoints in as friendly and relaxed a manner as possible while at the same time  
not sacrificing rigor these topics are developed in a straightforward step by step manner and are accompanied by numerous examples and exercises most of which are drawn from abstract  
algebra the first chapter of the book introduces the definitions of category and functor and discusses diagrams duality initial and terminal objects special types of morphisms and some  
special types of categories particularly comma categories and hom set categories chapter 2 is devoted to functors and natural transformations concluding with yoneda's lemma chapter 3  
presents the concept of universality and chapter 4 continues this discussion by exploring cones limits and the most common categorical constructions products equalizers pullbacks and  
exponentials along with their dual constructions the chapter concludes with a theorem on the existence of limits finally chapter 5 covers adjoints and adjunctions graduate and advanced  
undergraduates students in mathematics computer science physics or related fields who need to know or use category theory in their work will find an introduction to category theory to be
