evolution and utility as model systems for studying basic molecular biology

presents a comprehensive accessible and readily usable reference to the necessary formulations numerical schemes and innovative solution techniques for solving problems of heat and mass transfer and related fluid flows grouped by major sets of methods and functions the text describes new or improved as well as standard procedures this collection of contributions from leading figures in the field covers parabolic systems hyperbolic systems integral and integro differential systems monte carlo and perturbation methods inverse problems and more

this volume contains the contributions presented at the iutam symposium on asymptotic methods for turbulent shear flows which was the first international conference on the subject the book provides an overview of the state of the art in this field and presents results found worldwide asymptotic theory is here considered as the application of perturbation methods singular perturbation methods multiscale methods rapid distortion theory etc to solving the reynolds averaged flow equations for turbulent shear flows at high reynolds numbers these methods play an important role in turbulence modelling as is demonstrated by many examples including turbulence models describing flow separation it becomes evident that asymptotic methods enable the extraction of a fairly comprehensive set of results from the governing equations without incorporating a specific turbulence model a priori furthermore these methods can be used to quickly eliminate unsatisfactory models the book contains valuable results for turbulence researchers in particular for those working in turbulence modelling
