analytical chemistry 4 is a collection of plenary lectures presented at the international congress on analytical chemistry held in Kyoto, Japan, on April 3-7, 1972. This book contains 11 chapters and begins with a summary of the kinetics of complex formation of metals with organic ligands in analytical chemistry. The subsequent chapters deal with the chelate compounds, the concepts of trace analysis, the developments in quantitative organic ultramicro elementary analysis, and the status of radiochemistry and its application to activation analysis. These topics are followed by presentation of precipitation-based ion-selective electrodes with a particular emphasis on their most important analytical and physicochemical applications. A chapter briefly highlights the progress of analytical chemistry in Japan. The remaining chapters explore the direct metal and alloy analysis based on the selective modulation and resonance detection of conventional atomic absorption spectroscopy. These chapters also look into the status of analytical chemistry studies of air and water pollution. This text will be of great benefit to analytical chemists and researchers.

Fundamentals of analytical chemistry are usually presented as a sum of chemical and physical foundations, laws, axioms, and equations for analytical methods and procedures. In contrast, this book delivers a practice-oriented general guiding theory valid for all methods and techniques, starting with a closer look to analytical signals and their dependencies. All the important figures of merit characterizing the power of analytical procedures and the reliability of analytical results are discussed and quantified, such as sensitivity, precision, accuracy, and ruggedness. Elements of signal theory, information theory, statistics, and fundamentals of calibration are also presented. For this aim, the metrological foundations included define strictly the figures of merit in order to minimize confusions still appearing in analytical chemistry publications today.

In important branches of manufacturing industries, especially those producing chemicals, polymers, semiconductors, ceramics, metals, and alloys, analytical process control is already an integral part of the company. Far-reaching decisions with respect to quality, ecology, and economy are based on the respective analytical data. The goal of this practice-oriented book is to introduce chemists, engineers, and technicians to the strategies, techniques, and efficiency of modern process analytical chemistry. The author is especially aiming at those professionals in small and medium enterprises who have to carry out process control tasks in a solo run.
