technological systems become organized by commands from outside as when human intentions lead to the building of structures or machines but many natural systems become structured by their own internal processes these are the self organizing systems and the emergence of order within them is a complex phenomenon that intrigues scientists from all disciplines unfortunately complexity is ill defined global explanatory constructs such as cybernetics or general systems theory which were intended to cope with complexity produced instead a grandiosity that has now mercifully run its course and died most of us have become wary of proposals for an integrated systems approach to complex matters yet we must come to grips with complexity some how now is a good time to reexamine complex systems to determine

whether or not various scientific specialties can discover common principles or properties in them if they do then a fresh multidisciplinary attack on the difficulties would be a valid scientific task believing that complexity is a proper scientific issue and that self organizing systems are the foremost example r tomovic z damjanovic and i arranged a conference august 26 september 1 1979 in dubrovnik yugoslavia to address self organizing systems we invited 30 participants from seven countries included were biologists geologists physicists chemists mathematicians bio physicists and control engineers participants were asked not to bring manu scripts but rather to present positions on an assigned topic any writing would be done after the conference when the writers could benefit from their experiences there

this book is a logical continuation of volume 1 of the series entitled scientific fundamentals of robotics which presents all of the basic methods for computerized construction of dynamics of manipulation robots as well as the essential concepts of computer aided design of their mechanics vol 1 of the series also contains the main practical results from the elastodynamics of manipulation robots having in mind a need for forming a computer procedure which allows efficient checks of elastic deformations of a manipulator tip or some other of its characteristic points wishing to add a highly applications oriented dimension to the dynamic aspect of studies of manipulation robots the authors have made a kind of a topic based selection by leaving unconsidered some aspects of studies of robots such as elasticity and discussing others more important in their opinion to such an extent as suffices to make them practically applicable the authors have decided not to treat in detail the problem of flexible manipulation robots for two reasons the first results from the attitude that the permissible desired robot elasticity may satisfactorily well be tested using the method described in vol 1 of the series
