high speed impact dynamics is of interest in the fundamental sciences e g astrophysics and space sciences and has a number of important applications in military technologies homeland security and engineering when compared with experiments or numerical simulations analytical approaches in impact mechanics only seldom yield useful results however when successful analytical approaches allow us to determine general laws that are not only important in themselves but also serve as benchmarks for subsequent numerical simulations and experiments the main goal of this monograph is to demonstrate the potential and effectiveness of analytical methods in applied high speed penetration mechanics for two classes of problem the first class of problem is shape optimization of impactors penetrating into ductile concrete and some composite media the second class of problem comprises investigation of ballistic properties and optimization of multi layered shields including spaced and two component ceramic shields despite the massive use of mathematical techniques the obtained results have a clear engineering meaning and are presented in an easy to use form one of the chapters is devoted solely to some common approximate models and this is the first time that a comprehensive description of the localized impactor medium interaction approach is given in the monograph the authors present systematically their theoretical results in the field of high speed impact dynamics obtained during the last decade which only partially appeared in scientific journals and conferences proceedings

this book is a printed edition of the special issue combined scheduling and control that was published in processes

this is the proceedings of the iutam symposium on exploiting nonlinear dynamics for engineering systems that was held in novi sad serbia from july 15th to 19th 2018 the appearance of nonlinear phenomena used to be perceived as dangerous with a general tendency to avoid them or control them this perception has led to intensive research using various approaches and tailor made tools developed over decades however the nonlinear dynamics of today is experiencing a profound shift of paradigm since recent investigations rely on a different strategy which brings good effects of nonlinear phenomena to the forefront this strategy has a positive impact on different fields in science and engineering such as vibration isolation energy harvesting micro nano electro mechanical systems etc therefore the enolides symposium was devoted to demonstrate the benefits and to unlock the potential of exploiting nonlinear dynamical behaviour in these but also in other emerging fields of science and engineering this proceedings is useful for researchers in the fields of nonlinear dynamics of mechanical systems and structures and in mechanical and civil engineering

this major textbook provides comprehensive coverage of the analytical tools required to determine the dynamic response of structures the topics covered include

formulation of the equations of motion for single as well as multi degree of freedom discrete systems using the principles of both vector mechanics and analytical mechanics free vibration response determination of frequencies and mode shapes forced vibration response to harmonic and general forcing functions dynamic analysis of continuous systems and wave propagation analysis the key assets of the book include comprehensive coverage of both the traditional and state of the art numerical techniques of response analysis such as the analysis by numerical integration of the equations of motion and analysis through frequency domain the large number of illustrative examples and exercise problems are of great assistance in improving clarity and enhancing reader comprehension the text aims to benefit students and engineers in the civil mechanical and aerospace sectors

each number is the catalogue of a specific school or college of the university

for almost a decade now this textbook had been at the forefront in using modern analytical and computational codes and in addressing novel developments already used by numerous institutions for their courses this second edition has been substantially revised with new sections on biomechanics and micro and nanotechnology there is also more coverage of robotics multibody simulations and celestial mechanics numerous examples have been added and problems partly using matlab have been included free solutions manual available for lecturers at wiley vch de supplements
