after several decades of development the socialist market economy of china is now the world s second largest economy by nominal gdp china is also the largest economy by purchasing power parity according to the international monetary fund in tandem with the development of the chinese economy china s cancer burden is rising rapidly due to an ageing population and the adoption of unhealthy lifestyle behaviours according to the data from the national central cancer registry nccr of china the incidence and mortality of cancer have been increasing rapidly in china in recent years cancer has been the leading cause of death among city residents and the second cause of death among rural residents which has become a stark public health issue in china according to the nccr an estimated 4 29 million new incident cases 12 thousand per day and 2 81 million death cases 7 5 thousand per day would occur in 2015 in china this corresponds to the age standardized incidence rate asir of 201 1 per 100 000 and age standardized mortality rate asmr of 126 9 per 100 000 respectively due to the geographical and ethnical disparities in living habits and healthcare level the cancer spectrum differs between different regions and ethnical groups in china according to the estimation from iarc the incidence of nasopharyngeal

carcinoma and liver cancer is the world's highest in specific regions of China. The incidence of some cancer types in Chinese urban areas such as colorectal prostate kidney and bladder cancers is similar to that in developed countries or regions where the incidence of cancer is highly associated with obesity and westernised lifestyles. Nevertheless the incidence of some common cancer types in rural areas including oesophageal stomach liver and cervical cancers shares similarity with less developed countries or regions in the world where cancers are associated with chronic infectious agents due to poverty in addition the mortality rate is higher in rural areas which suggests a poorer cancer prognosis due to late diagnosis and or unsatisfying clinical treatment. The distinct cancer patterns of different regions and or ethnic groups indicate a need for precise cancer prevention and control plans tailored for different geographical regions and or ethnic groups. The overarching goal of the proposed frontiers in oncology research topic is to present current perspectives on cancer epidemiology in Chinese characteristics and provide current knowledge of cancer burden as well as cancer mortality to academic investigators clinicians and stakeholders from the translational clinical and public health communities.

Epidemiological studies show that cancer incidence is far more dependent on the conditions of life than previously supposed. Classically cancers occurred with heavy exposure to a specific occupational hazard or were associated with habits in some instances research shows the incidence of cancer falls when the method of work or the associated habit is changed in short variation in incidence is now known to be the rule rather than the exception. In cancer no cancer that occurs with even moderate frequency occurs everywhere and always to the same extent sometimes it is even epidemic similar in scale to an epidemic of infectious disease but modified by the fact that the induction period may be as much as thirty years. Prevention of cancer is now coming to be regarded as a practicable alternative to its cure. We remain almost totally ignorant of how cancer is produced at the cellular level and until we know this our methods of prevention are liable to be cumbersome and inefficient. Ethical considerations and the time scale of the disease make it impossible to obtain experimental evidence in man and what action to take has been determined from observing nature's experiments and by analogy from experiments in animals. The evidence from epidemiological studies is of particular interest such studies suggest relationships that would never be thought of in the ordinary course of laboratory work and results that are directly relevant to the problems of human disease. The large numbers at risk and the intensity of the medical care to which people with cancer are subjected make it possible to recognize relatively small improvements such practical decisions based on information thus obtained have largely eliminated the risk of cancer due to occupational hazards in several industries.

a summary of the epidemiology of human cancer

Despite an enormous investment of effort throughout the world cancer is still a major barrier to human longevity. Cancer deaths are estimated to be more than five million globally currently responsible for about 20% of all deaths in developed countries. The burden of cancer is steadily increasing in the developing world following the control of malnutrition and infectious and parasitic diseases. Deeply impressed by the report of the symposium on geographic pathology and demography of cancer held at Oxford in 1950 and through his preliminary work on cancer mortality statistics in Japan Professor M. Segi decided to devote his life to the fight against cancer by establishing worldwide comparative cancer statistics one of the landmarks in cancer studies and in cancer prevention strategies he and his associates published six

volumes of cancer mortality in 24 countries with reliable mortality statistics covering 1950-1967 using the world population which he had derived as a standard these publications rapidly became standard works of reference on the subject throughout the world professor segi was a pioneer of cancer epidemiology in japan he cleaved a path through the jungle of cancer using epidemiological methods by promoting cancer studies he overcame the poor understanding of malignant disease which existed after world war ii when cancer mortality rates were still low
