Solving Problems from Fundamentals of Molecular Spectroscopy Lets delve into specific problemsolving approaches using examples from Banwells book

3 1 Infrared Spectroscopy Problem A molecule exhibits a strong absorption band at 1715 cm in its IR spectrum What functional group is likely present Solution The absorption band at 1715 cm is characteristic of the carbonyl CO stretching vibration This strong absorption arises from the large dipole moment change associated with the stretching motion Therefore the molecule likely contains a carbonyl group such as in aldehydes ketones or carboxylic acids

2 Raman Spectroscopy Problem A molecule exhibits a strong Raman band at 2900 cm What type of vibration is responsible for this band Solution The Raman band at 2900 cm is characteristic of the CH stretching vibration This vibration is Raman active because it involves a change in polarizability during the vibration The intensity of the band is strong due to the high polarizability of the CH bond

3 Nuclear Magnetic Resonance NMR Spectroscopy Problem A compound exhibits a singlet signal at 21 ppm in its <sup>1</sup>H NMR spectrum What structural feature is likely responsible for this signal Solution The singlet signal at 21 ppm in <sup>1</sup>H NMR is characteristic of a methyl group CH that is not coupled to any adjacent protons This suggests the methyl group is attached to a quaternary carbon atom or a carbon atom bearing only one hydrogen atom

4 Electronic Spectroscopy Problem A molecule absorbs strongly in the ultraviolet region of the electromagnetic spectrum What kind of electronic transition is likely occurring Solution Strong absorption in the UV region is characteristic of electronic transitions involving  $\pi \rightarrow \pi^*$  transitions transitions are associated with unsaturated systems while  $n \rightarrow \pi^*$  transitions involve lone pairs of electrons on heteroatoms

5 Combining Spectroscopic Techniques Problem A compound with a molecular formula CHO exhibits the following spectroscopic data IR strong absorption at 1715 cm <sup>1</sup>H NMR singlet at 21 ppm 3H triplet at 10 ppm 3H quartet at 24 ppm 2H 4 Solution The IR spectrum indicates the presence of a carbonyl group CO The <sup>1</sup>H NMR spectrum suggests three distinct types of protons A methyl group CH at 21 ppm singlet A methyl group CH at 10 ppm triplet likely adjacent to a methylene group CH A methylene group CH at 24 ppm quartet likely adjacent to the methyl group at 10 ppm This data points towards the structure of 2butanone a ketone with a carbonyl

group at the second carbon atom
