this is an introduction to the basic tools of mathematics needed to understand the relation between knot theory and quantum gravity the book begins with a rapid course on manifolds and differential forms emphasizing how these provide a proper language for formulating maxwell s equations on arbitrary spacetimes the authors then introduce vector bundles connections and curvature in order to generalize maxwell theory to the yang mills equations the relation of gauge theory to the newly discovered knot invariants such as the jones polynomial is sketched riemannian geometry is then introduced in order to describe einstein s equations of general relativity and show how an attempt to quantize gravity leads to interesting applications of knot theory

the closed orbits of three dimensional flows form knots and links this book develops the tools template theory and symbolic dynamics needed for studying knotted orbits this theory is applied to the problems of understanding local and global bifurcations as well as the embedding data of orbits in morse-smale and integrable hamiltonian flows the necessary background theory is sketched however some familiarity with low dimensional topology and differential equations is assumed
