surveys the selection design and operation of most of the industrially important separation processes discusses the underlying principles on which the processes are based and provides illustrative examples of the use of the processes in a modern context features thorough treatment of newer separation processes based on membranes adsorption chromatography ion exchange and chemical complexation includes a review of historically important separation processes such as distillation absorption extraction leaching and crystallization and considers these techniques in light of recent developments affecting them

an exact analytical solution is found for laminar constant property slug flow over a thin plate which is also convectively cooled from below the solution is found by means of two successive laplace transformations when a transient in the plate and the fluid is initiated by a step change in the fluid inlet temperature the exact solution yields the transient fluid temperature surface heat flux and surface temperature distributions the results of the exact transient solution for the surface heat flux are compared to the quasi steady values and a criterion for the validity of the quasi steady results is found also the effect of the plate coupling parameter on the surface heat flux are investigated
