the satisfiability sat problem is central in mathematical logic computing theory and many industrial applications there has been a strong relationship between the theory the algorithms and the applications of the sat problem this book aims to bring together work by the best theorists algorithmists and practitioners working on the sat problem and on industrial applications as well as to enhance the interaction between the three research groups the book features the applications of theoretical algorithmic results to practical problems and presents practical examples for theoretical algorithmic study major topics covered in the book include practical and industrial sat problems and benchmarks significant case studies and applications of the sat problem and sat algorithms new algorithms and improved techniques for satisfiability testing specific data structures and implementation details of the sat algorithms and the theoretical study of the sat problem and sat algorithms

this monograph deals with theoretical and practical aspects of creating course timetables at academic institutions the task is typically to create a timetable that suits the requirements of the stakeholders students lecturers and the administration as well as possible the book presents an exposition of the basic combinatorial problems and solution methods for course timetabling and related tasks it provides a rigorous treatment of fairness issues that arise in the course timetabling context and shows how to deal with the potentially conflicting interests of the stakeholders the proposed methods are also readily applicable to other classes of scheduling problems such as staff rostering finally it presents a comprehensive case study on the implementation of an automated course timetabling system at the school of engineering of the university of erlangen nuremberg the case study includes a detailed description of the problem model as well as an evaluation of stakeholder satisfaction

this innovative textbook presents the key foundational concepts for a one semester undergraduate course in the theory of computation it offers the most accessible and motivational course material available for undergraduate computer theory classes directed at undergraduates who may have difficulty understanding the relevance of the course to their future careers the text helps make them more comfortable with the techniques required for the deeper study of computer science the text motivates students by clarifying complex theory with many examples exercises and detailed proofs this book is shorter and more accessible than the books now being used in core computer theory courses theory of computing is a standard required course in all computer science departments

first published in 1987 the seven chapters that comprise this book review contemporary work on the geometric side of robotics the first chapter defines the fundamental goal of robotics in very broad terms and outlines a research agenda each of whose items constitutes a substantial area for further

research the second chapter presents recently developed techniques that have begun to address the geometric side of this research agenda and the third reviews several applied geometric ideas central to contemporary work on the problem of motion planning the use of voronoi diagrams a theme opened in these chapters is explored further later in the book the fourth chapter develops a theme in computational geometry having obvious significance for the simplification of practical robotics problems the approximation or decomposition of complex geometric objects into simple ones the final chapters treat two examples of a class of geometric reconstruction problem that have immediate application to computer aided geometric design systems

tools and technologies and impact on society that genetic programming and algorithms have had throughout multiple industries by taking a multi industry approach this book covers the fundamentals of genetic programming through its technological benefits and challenges along with the latest advancements and future outlooks for computer science this book is ideal for academicians biological engineers computer programmers scientists researchers and upper level students seeking the latest research on genetic programming

in recent years ai has been experiencing a deep internal debate on the appropriateness of the symbolic based paradigm and all of its consequences while various symbolic representation schemes as well as their integration have been proposed their limitations have continuously pushed researchers for improved versions or entirely new ones new viewpoints such as the complex dynamic based approach with neural nets can be regarded simply as new problem solving techniques with specific properties under this perspective what seems to be important is the ability to combine heterogeneous representation and problem solving techniques research on heterogeneous intelligent systems goes hand in hand with research on specific problem solving methods and paradigms therefore representing their conceptual and practical glueing element the papers contained in this proceedings are just one instance of such awareness activity in the international scientific community
