this book provides a comprehensive practical treatment of the modelling of electrical power systems and the theory and practice of fault analysis of power systems covering detailed and advanced theories as well as modern industry practices the continuity and quality of electricity delivered safely and economically by today's and future's electrical power networks are important for both developed and developing economies the correct modelling of power system equipment and correct fault analysis of electrical networks are pre requisite to ensuring safety and they play a critical role in the identification of economic network investments environmental and economic factors require engineers to maximise the use of existing assets which in turn require accurate modelling and analysis techniques the technology described in this book will always be required for the safe and economic design and operation of electrical

power systems the book describes relevant advances in industry such as in the areas of international standards developments emerging new generation technologies such as wind turbine generators fault current limiters multi phase fault analysis measurement of equipment parameters probabilistic short circuit analysis and electrical interference a fully up to date guide to the analysis and practical troubleshooting of short circuit faults in electricity utilities and industrial power systems covers generators transformers substations overhead power lines and industrial systems with a focus on best practice techniques safety issues power system planning and economics north american and british european standards covered

the roots of this book and of the new research field that it defines lie in the scaling of vlsi technology with gigahertz system clocks and ever accelerating design and process innovations interconnects have become the limiting factor for both performance and density this increasing impact of interconnects on the system implementation space necessitates new tools and analytic techniques to support the system designer with respect to modeling and analysis the response to interconnect dominance is evolutionary atomistic and grain level models of interconnect structure and performance models at multi gigahertz operating frequencies together guide the selection of improved materials and process technologies e g damascene copper wires low permittivity dielectrics previously insignificant effects e g mutual inductance are added into performance models as older approximations e g lumped capacitance gate load models are discarded however at the system level and chip planning level the necessary response to interconnect dominance is revolutionary convergent design flows do not require only distributed rlc line models repeater awareness unifications with extraction and analysis etc rather issues such as wiring layer assignment and early prediction of the resource and performance envelope for the system interconnect in particular based on statistical models of the system interconnect structure also become critical indeed system level interconnect prediction has emerged as the enabler of improved interconnect modeling more cost effective system architectures and more productive design technology
