a complete account of evolutionary thought in the social environmental and policy sciences creating bridges with biology

this is an examination of the relationship between classification and evolutionary theory with reference to the competing schools of taxonomic thinking emphasis is placed on one of these schools the transformed cladists who have attempted to reject all evolutionary thinking in classification and to cast doubt on evolution in general the author examines the limits to this line of thought from a philosophical and methodological perspective he concludes that transformed cladistics does not achieve what it claims and that it either implicitly assumes a platonic world view or is unintelligible without taking into account evolutionary processes the very processes it claims to reject through this analysis the author attempts to formulate criteria of an objective and consistent nature that can be used to judge competing methodologies and theories philosophers of science zoologists interested in taxonomy and evolutionary biologists will find this a compelling study

to some potential readers of this book the description of biological systematics as an art may seem outdated and frankly wrong for most people art is subjective and unconstrained by universal laws while one picture play or poem may be internally consistent comparison between different art products is meaningless except by way of the individual artists on the other hand modern biological systematics particularly phenetics and cladistics is offered as objective and ultimately governed by universal laws this implies that classifications of different groups of organisms being the products of systematics should be comparable irrespective of authorship throughout this book minelli justifies his title by developing the theme that biological classifications are in fact very unequal in their expressions of the pattern and processes of the natural world specialists are imbued with their own groups and tend to establish a consensus of what constitutes a species or a genus or whether it should be desirable to recognize sub species cultivars etc ornithologists freely recognize subspecies and rarely do bird genera contain more than 10 species on the other hand some coleopterists and botanists work with genera with over 1500 species this asymmetry may reflect a biological reality it may express a working practicality or simply an historical artefact older erected genera often contain more species rarely are these phenomena questioned

karp continues to help biologists make important connections between key concepts and experimentation the sixth edition explores core concepts in considerable depth and presents experimental detail when it helps to explain and reinforce the concepts the majority of discussions have been modified to reflect the latest changes in the field the book also builds on its strong illustration program by opening each chapter with vip art that serves as a visual summary for the chapter over 60 new micrographs and computer derived images have been added to enhance the material biologists benefit from these changes as they build their skills in making the connection
