this book completes a trilogy numbers 5 7 and 8 of the series the classification of the finite simple groups treating the generic case of the classification of the finite simple groups in

conjunction with numbers 4 and 6 it allows us to reach a major milestone in our series the completion of the proof of the following theorem theorem o let  $G$  be a finite simple group of odd type all of whose proper simple sections are known simple groups then either  $G$  is an alternating group or  $G$  is a finite group of lie type defined over a field of odd order or  $G$  is one of six sporadic simple groups put another way theorem o asserts that any minimal counterexample to the classification of the finite simple groups must be of even type the work of aschbacher and smith shows that a minimal counterexample is not of quasithin even type while this volume shows that a minimal counterexample cannot be of generic even type modulo the treatment of certain intermediate configurations of even type which will be ruled out in the next volume of our series

the three volume series history of the theory of numbers is the work of the distinguished mathematician leonard eugene dickson who taught at the university of chicago for four decades and is celebrated for his many contributions to number theory and group theory this second volume in the series which is suitable for upper level undergraduates and graduate students is devoted to the subject of diophantine analysis it can be read independently of the preceding volume which explores divisibility and primality and volume iii which examines quadratic and higher forms featured topics include polygonal pyramidal and figurate numbers linear diophantine equations and congruences partitions rational right triangles triangles quadrilaterals and tetrahedra the sums of two three four and  $n$  squares the number of solutions of quadratic congruences in  $n$  unknowns liouville's series of eighteen articles the pell equation squares in arithmetical or geometrical progression equations of degrees three four and  $n$  sets of integers with equal sums of like powers waring's problem and related results fermat's last theorem and many other related subjects indexes of authors cited and subjects appear at the end of the book

this book resulted from two reports published in 1928 and 1932 of the committee on rational transformations established by the national research council the purpose of the reports was to give a comprehensive survey of the literature on the subject each chapter is regarded as a separate unit that can be read independently

written by a distinguished university of chicago professor this 2nd volume in the series history of the theory of numbers presents material related to diophantine analysis 1919 edition

this is an introduction to mathematical logic in which all the usual topics are presented compactness and axiomatizability of semantical consequence löwenheim skolem tarski theorems prenex and other normal forms and characterizations of elementary classes with

the help of ultraproducts logic is based exclusively on semantics truth and satisfiability of formulas in structures are the basic notions the methods are algebraic in the sense that notions such as homomorphisms and congruence relations are applied throughout in order to gain new insights these concepts are developed and can be viewed as a first course on universal algebra the approach to algorithms generating semantical consequences is algebraic as well for equations in algebras for propositional formulas for open formulas of predicate logic and for the formulas of quantifier logic the structural description of logical consequence is a straightforward extension of that of equational consequence as long as boolean valued propositions and boolean valued structures are considered the reduction of the classical 2 valued case then depends on the boolean prime ideal theorem
