updated to reflect changes in the field since publication of the first edition in 1979 provides a detailed review of the methodology available for assessing the diagnosis and prognosis of cancer patients including data on the application of tumor marker assays and other immunodiagnostic procedures

gastric cancer gc represents a serious health problem on a global scale despite some recent advances in the field the prognosis in gc remains poor a better understanding of molecular biology which would lead to improved treatment options is needed many potential biomarkers of prognostic significance have been identified however inhibition of only her2 protein has led to a modest survival benefit a deeper understanding of the pathogenesis and biological features of gastric cancer including the identification and characterization of diagnostic prognostic predictive and therapeutic biomarkers hopefully will provide improved clinical outcomes this research topic aims to provide a comprehensive overview on recent progress in emerging molecular biomarkers for gastric cancer we welcome the submission of review and original research articles covering but not limited to the following topics 1 novel diagnostic molecules to improve the early detection rate for gastric cancer 2 novel prognostic molecules to stratify gastric cancer patients into different risk 3 novel therapeutic biomarker which could serve as target for treating gastric cancer 4 novel biomarker to predict chemotherapy response of gastric cancer patients

plants that fight cancer second edition is a compilation that reviews cancer treatment and research based information on the plant kingdom as the source of both known and novel chemical moieties and mixtures many of them still under identification this new edition follows the organization of the first book with a considerable expansion of content that more than doubles the volume of information divided into four segments the first part is dedicated to a review of our current knowledge of cancer the different types and incidence the molecular pathways of the disease and the various treatment protocols with an emphasis on chemotherapy the second part is a brief journey in pharmacognosy with detailed information about each of the fourteen different chemical groups of plant secondary metabolites their use in cancer chemotherapy and updated information on the biotechnological production of the most representative compounds in clinical practice the third part of the book comprises six chapters dedicated to either plant chemotherapeutical approaches to specific cancer types e g bladder prostate or specific groups of plant secondary metabolites with novel and promising properties for cancer treatment e g naphthoquinones lectins phenanthridone alkaloids the fourth part containing investigative information on almost 300 individual plant species with established anticancer properties either on a clinical or in vitro level is with no doubt the most analytical this new edition contains chapters on cytotoxic phenanthridone alkaloid constituents of the amaryllidaceae naphthoquinone contained anticancer terrestrial plants polyphenols and cancer immunology medicinal plant product based fabrication nanoparticles au and ag and their anticancer effects bladder and prostate cancer and plant lectins in cancer treatment features provides efficient information for all kinds of cancer and plant chemotherapeutical approaches to specific cancer types discusses specific groups of plant secondary metabolites with novel and promising properties for cancer treatment provides scientific information for medicinal uses of various plants contains analytical information on almost 300 individual plant species with established anticancer properties either on a clinical or in vitro level focuses on plant genera and species that are either already used in cancer chemotherapy or have been identified with antitumor and antileukemic properties to a bigger or lesser extent

bladder cancer is one of the most common urological diseases with a high mortality rate and poor prognosis it is currently ranked as the 10th most common malignancy worldwide the majority of bladder cancer patients have been found to be diagnosed with non muscle invasive bladder cancer nmibc and the remaining are diagnosed with muscle invasive bladder cancer mibc although there have been advances in the treatment and therapies provided for bladder cancer patients the survival rate remains low primarily due to recurrence and metastasis of the disease following treatment surgical treatment is currently the most common form including radical cystectomy which is the standard form of treatment combined with neoadjuvant chemotherapy however the 5 year overall survival rate is 50 therefore further studies are required to understand the molecular mechanisms involved in the progression of bladder cancer and identify novel biomarkers to act as a diagnostic tool for patients there have been many studies involving the detection of biomarkers in bladder cancer in addition to monitoring disease recurrence to understand the impact and predict potential outcomes a variety of urine biomarkers have been developed to detect bladder cancer and prognostic risk stratification including mutational dna and the levels of rna expression circulating tumor cells have also been identified as a potential biomarker for bladder cancer patients however there are significant challenges as bladder cancer has demonstrated high levels of cellular and molecular heterogeneity and some markers do not have sufficient sensitivity for accurate detection therefore further studies are required to continue to identify new novel biomarkers for bladder cancer the aim of this research topic is to discuss novel biomarkers in bladder cancer and how it impacts the disease progression and the survival rate for bladder cancer patients

the first edition of human genome epidemiology published in 2004 discussed how the epidemiologic approach provides an important scientific foundation for studying the continuum from gene discovery to the development applications and evaluation of human genome information in improving health and preventing disease since that time advances in human genomics have continued to occur at a breathtaking pace with contributions from leaders in the field from around the world this new edition is a fully updated look at the ways in which genetic factors in common diseases are studied methodologic developments in collection analysis and synthesis of data as well as issues surrounding specific applications of human genomic information for medicine and public health are all discussed in addition the book focuses on practical applications of human genome variation in clinical practice and disease prevention students clinicians public health professionals and policy makers will find the book a useful tool for understanding the rapidly evolving methods of the discovery and use of genetic information in medicine and public health in the 21st century
