dr paris has written an honest balanced presentation of the ways in which psychiatric drugs are evaluated and prescribed he highlights the complexity of the task the limits of what is known and the mixed picture that research often produces his conclusions are refreshing because they are built from an even handed pragmatic assessment of the empirical evidence the result is a stimulating look at the world of treatments for emotional disorders that acknowledges the usefulness of both biological and psychosocial explanations where appropriate his recommendations provide helpful roadmaps for patients practitioners and researchers alike the book is sure to serve as a welcome catalyst for the continuing debates about which treatments are likely to produce the best outcomes roger p greenberg ph d distinguished professor and head psychology division dept of psychiatry behavioral science suny upstate medical university ny usa the message of this book is that psychiatrists have some very good drugs but can expect bad results when they are over used prescribed outside of evidence based indications or given to the wrong patients while acknowledging that many current agents are highly effective and have revolutionized the treatment of certain disorders joel paris criticizes their use outside of an evidence base too many patients are either over medicated or are misdiagnosed to justify aggressive treatment dr paris calls for more government funding of clinical trials to establish without bias the effectiveness of these agents he has written this book for practitioners and trainees to show that scientific evidence supports a more cautious and conservative approach to drug therapy after describing the history of

psychopharmacology including its early successes dr paris reviews the relationship between psychiatry and the pharmaceutical industry this problem has received considerable popular attention in recent years and dr paris documents initiatives to increase transparency and decrease the influence of pharmaceutical marketing on diagnosis and prescribing habits dr paris then examines some major controversies one is the fact that newer drugs have not been shown to be superior to older agents another is that while the number of prescriptions for antidepressants has increased dramatically meta analyses show that their value is more limited than previously believed still another is the widespread prescription of mood stabilizers and antipsychotic drugs for patients including children and adolescents who do not have bipolar illness polypharmacy is an especially contentious area very few drug combinations have been tested in clinical trials yet many patients end up on a cocktail of powerful drugs each with its own side effects dr paris briefly considers alternatives to pharmacology and again calls for more clinical trials of these approaches he also discusses the current trend to medicalizing what many would describe as normal distress and states succinctly some things in life are worth being upset about
