Hershey Park Physics Packet Solutions Hershey Park Physics Packet Solutions Introduction to Hershey Park Physics Hershey Park, nestled in Pennsylvania, is renowned not only for its exhilarating rides and attractions but also as an excellent practical setting for exploring physics principles. Many educators leverage Hershey Park as a real-world example for teaching concepts such as motion, energy, forces, and momentum. A Hershey Park physics packet typically includes a series of problems and questions designed to reinforce these fundamental ideas, often involving calculations related to roller coasters, rides, and the physics of amusement park attractions. Providing solutions to such packets helps students understand the practical applications of physics concepts, enhance problem-solving skills, and prepare for exams or projects. Understanding the Core Concepts in Hershey Park Physics Packets Before diving into specific solutions, it's essential to grasp the core physics principles frequently encountered in Hershey Park scenarios: Potential and Kinetic Energy: How energy transforms as rides ascend and descend. Newton's Laws of Motion: Analyzing forces acting on rides and passengers. Friction and Air Resistance: Their roles in ride motion and energy loss. Velocity and Acceleration: Calculating speeds and changes during rides. Momentum and Impulse: Impact during sudden stops or collisions. Gravitational Force: Its influence on roller coaster drops and ride design. Typical Problems in Hershey Park Physics Packets Problems often revolve around specific rides or scenarios, such as calculating the speed of a roller coaster at various points, determining the g-forces experienced by riders, or analyzing the energy transformations involved in ride operation. Some common problem types include: - Calculating the velocity of a roller coaster at different heights - Determining the maximum g-force experienced on a ride - Estimating the energy lost due to friction - Analyzing the forces acting on passengers during inversions - Calculating the work done by motors to lift rides 2 Sample Hershey Park Physics Problems and Solutions Problem 1: Roller Coaster Speed at the Bottom of a Drop Question: A roller coaster car is pulled up to a height of 50 meters. Assuming negligible friction and air resistance, what is its speed at the bottom of the drop? Solution Approach: This problem involves conservation of mechanical energy, where potential energy at the top converts into kinetic energy at the bottom. Step-by-step Solution: 1. Identify known values: - Height,  $(h = 50\text{ m})$  - Gravitational acceleration,  $(g = 9.8\text{ m/s}^2)$  - Initial potential energy,  $(PE = mgh)$  -

Kinetic energy at the bottom,  $\left( KE = \frac{1}{2}mv^2 \right)$  2. Apply conservation of energy:  $\left[ PE_{\text{top}} = KE_{\text{bottom}} \right]$   $\left[ mgh = \frac{1}{2}mv^2 \right]$  3. Solve for velocity  $\left( v \right)$ :  $\left[ v = \sqrt{2gh} \right]$  4. Calculate:  $\left[ v = \sqrt{2 \times 9.8 \times 50} \right]$   $\left[ v = \sqrt{980} \right]$   $\left[ v \approx 31.3 \right]$   $\left[ \text{m/s} \right]$  Answer: The roller coaster reaches approximately 31.3 meters per second at the bottom of the drop.

--- Problem 2: G-Force Experienced During a Loop Question: A roller coaster loop has a radius of 15 meters. If the car is at the bottom of the loop moving at 20 m/s, what is the g-force experienced by the riders? Solution Approach: Calculate the centripetal acceleration and compare it to gravitational acceleration to find the g-force. Step-by-step Solution: 1. Centripetal acceleration:  $\left[ a_c = \frac{v^2}{r} \right]$   $\left[ a_c = \frac{(20)^2}{15} = \frac{400}{15} \approx 26.67 \right]$   $\left[ \text{m/s}^2 \right]$  2. Total acceleration felt by riders: At the bottom, riders feel the normal force, which provides the centripetal acceleration plus counteracts gravity:  $\left[ F_{\text{normal}} = m(g + a_c) \right]$  3. Calculate g-force:  $\left[ \text{G-force} = \frac{a_{\text{total}}}{g} = \frac{g + a_c}{g} \right]$   $\left[ = \frac{9.8 + 26.67}{9.8} \approx \frac{36.47}{9.8} \approx 3.72 \right]$  Answer: Riders experience approximately 3.72 g's at the bottom of the loop.

--- Problem 3: Energy Loss Due to Friction Question: A roller coaster initially has a potential energy of 100,000 Joules at the top of the track. If, after descending, the car's kinetic energy is 80,000 Joules, how much energy was lost to friction and air resistance? Solution Approach: Use energy conservation with consideration for energy losses. Step-by-step Solution: 1. Initial potential energy:  $\left[ PE_{\text{initial}} = 100,000 \right]$   $\left[ \text{J} \right]$  2. Final kinetic energy:  $\left[ KE_{\text{final}} = 80,000 \right]$   $\left[ \text{J} \right]$  3. Energy lost:  $\left[ \text{Energy lost} = PE_{\text{initial}} - KE_{\text{final}} \right]$   $\left[ = 100,000 - 80,000 = 20,000 \right]$   $\left[ \text{J} \right]$  Answer: Approximately 20,000 Joules of energy were lost due to friction and air resistance.
