nonassociative rings and algebras quasigroups loops and related systems as well as applications of nonassociative algebra to geometry physics and natural sciences

this book is an expanded text for a graduate course in commutative algebra focusing on the algebraic underpinnings of algebraic geometry and of number theory accordingly the theory of affine algebras is featured treated both directly and via the theory of noetherian and artinian modules and the theory of graded algebras is included to provide the foundation for projective varieties book jacket

this book is a companion volume to graduate algebra commutative view published as volume 73 in this series the main and most important feature of the book is that it presents a unified approach to many important topics such as group theory ring theory lie algebras and gives conceptual proofs of many basic results of noncommutative algebra there are also a number of major results in noncommutative algebra that are usually found only in technical works such as zelmanov s proof of the restricted burnside problem in group theory word problems in groups tits s alternative in algebraic groups pi algebras and many of the roles that coxeter diagrams play in algebra the first half of the book can serve as a one semester course on noncommutative algebra whereas the remaining part of the book describes some of the major directions of research in the past 100 years the main text is extended through several appendices which permits the inclusion of more advanced material and numerous exercises the only prerequisite for using the book is an undergraduate course in algebra whenever necessary results are quoted from graduate algebra commutative view

this volume reflects the proceedings of the international conference on representations of affine and quantum affine algebras and their applications held at north carolina state university raleigh in recent years the theory of affine and quantum affine lie algebras has become an important area of mathematical research with numerous applications in other areas of mathematics and physics three areas of recent progress are the focus of this volume affine and quantum affine algebras and their generalizations vertex operator algebras and their representations and applications in combinatorics and statistical mechanics talks given by leading international experts at the conference offered both overviews on the subjects and current research results the book nicely presents the interplay of these topics recently occupying centre stage in the theory of infinite

dimensional lie theory

the institute for theoretical and experimental physics itep is internationally recognized for achievements in various branches of theoretical physics for many years the seminars at itep have been among the main centers of scientific life in moscow this volume is a collection of articles by participants of the seminar on mathematical physics that has been held at itep since 1983 this is the second such collection the first was published in the same series ams translations series 2 vol 191 the papers in the volume are devoted to several mathematical topics that strongly influenced modern theoretical physics among these topics are cohomology and representations of infinite lie algebras and superalgebras hitchin and knizhnik zamolodchikov bernard systems and the theory of d modules the book is intended for graduate students and research mathematicians working in algebraic geometry representation theory and mathematical physics

this book describes the history of jordan algebras and describes in full mathematical detail the recent structure theory for jordan algebras of arbitrary dimension due to efim zel manov jordan algebras crop up in many surprising settings and find application to a variety of mathematical areas no knowledge is required beyond standard first year graduate algebra courses

gradings are ubiquitous in the theory of lie algebras from the root space decomposition of a complex semisimple lie algebra relative to a cartan subalgebra to the beautiful dempwolff decomposition of e 8 as a direct sum of thirty one cartan subalgebras this monograph is a self contained exposition of the classification of gradings by arbitrary groups on classical simple lie algebras over algebraically closed fields of characteristic not equal to 2 as well as on some nonclassical simple lie algebras in positive characteristic other important algebras also enter the stage matrix algebras the octonions and the albert algebra most of the presented results are recent and have not yet appeared in book form this work can be used as a textbook for graduate students or as a reference for researchers in lie theory and neighbouring areas this book is published in cooperation with atlantic association for research in the mathematical sciences aarms
