the falling cat is an interesting theme to pursue in which geometry mechanics and control are in action together as is well known cats can almost always land on their feet when tossed into the air in an upside down attitude if cats are not given a non vanishing angular momentum at an initial instant they cannot rotate during their motion and the motion they can make in the air is vibration only however cats accomplish a half turn without rotation when landing on their feet in order to solve this apparent mystery one needs to thoroughly understand rotations and vibrations the connection theory in differential geometry can provide rigorous definitions of rotation and vibration for many body systems deformable bodies of cats are not easy to treat mechanically a feasible way to approach the question of the falling cat is to start with many body systems and then proceed to rigid bodies and further to jointed rigid bodies which can approximate the body of a cat in this book the connection theory is applied first to a many body system to show that vibrational motions of the many body system can result in rotations without performing rotational motions and then to the cat model consisting of jointed rigid bodies on the basis of this geometric setting mechanics of many body systems and of jointed rigid bodies must be set up in order to take into account the fact that cats can deform their bodies three torque inputs which may give a twist to the cat model are applied as control inputs under the condition of the vanishing angular momentum then a control is designed according to the port controlled hamiltonian method for the model cat to perform a half turn and to halt the motion upon landing the book also gives a brief review of control systems through simple examples to explain the role of control inputs
