this book brings together in a novel way an account of the structure of time with an account of our language and thought about time joshua mozersky argues that it is possible to reconcile the human experience of time which is centred on the present with the objective conception of time according to which all moments are intrinsically alike he defends a temporally centreless ontology along with a tenseless semantics that is compatible with and indeed helps to explain the need for tensed language and thought this theory of time also it is argued helps to elucidate the nature of change and temporal passage neither of which need be denied nor relegated to the realm of subjective experience only the book addresses a variety of topics including whether the past and future are real whether temporal passage is a genuine phenomenon or merely a subjective illusion how the

throughout its early history photography s authenticity was contested and challenged how true a representation of reality can a photograph provide does the reproduction of a photograph affect its value as authentic or not from a photograph examines these questions in the light of the early scientific periodical press exploring how the perceived veracity of a photograph its use as scientific evidence and the technologies developed for printing it were intimately connected before photomechanical printing processes became widely used in the 1890s scientific periodicals were unable to reproduce photographs and instead included these photographic images as engravings with the label from a photograph consequently every image was mediated by a human interlocutor introducing the potential for error and misinterpretation rather than reading photographs in the context of where or how they were taken this book emphasises the importance of understanding how photographs are reproduced it explores and compares the value of photography as authentic proof in both popular and scientific publications during this period of significant technological developments and a growing readership three case studies investigate different uses of photography in print using pigeons to transport microphotographs during the franco prussian war the debate surrounding the development of instantaneous photography and finally the photographs taken of the transit of venus in 1874 unseen by the human eye but captured on camera and made accessible to the public through the periodical addressing a largely overlooked area of photographic history from a photograph makes an important contribution to this interdisciplinary research and will be of interest to historians of photography print culture and science

this monograph identifies the essential characteristics of the objects described by current quantum theory and considers their relationship to space time in the process it explicates the senses in which quantum objects may be consistently considered to have parts of which they may be composed or into which they may be decomposed the book also demonstrates the degree to which reduction is possible in quantum mechanics showing it to be

related to the objective indefiniteness of quantum properties and the strong non local correlations that can occur between the physical quantities of quantum subsystems careful attention is paid to the relationships among such property correlations physical causation probability and symmetry in quantum theory in this way the text identifies and clarifies the conceptual grounds underlying the unique nature of many quantum phenomena

this book is designed as a text for graduate courses in stochastic processes it is written for readers familiar with measure theoretic probability and discrete time processes who wish to explore stochastic processes in continuous time the vehicle chosen for this exposition is brownian motion which is presented as the canonical example of both a martingale and a markov process with continuous paths in this context the theory of stochastic integration and stochastic calculus is developed the power of this calculus is illustrated by results concerning representations of martingales and change of measure on wiener space and these in turn permit a presentation of recent advances in financial economics option pricing and consumption investment optimization this book contains a detailed discussion of weak and strong solutions of stochastic differential equations and a study of local time for semimartingales with special emphasis on the theory of brownian local time the text is complemented by a large number of problems and exercises

electrons neutrons and protons in engineering focuses on the engineering significance of electrons neutrons and protons the emphasis is on engineering materials and processes whose characteristics may be explained by considering the behavior of small particles when grouped into systems such as nuclei atoms gases and crystals this volume is comprised of 25 chapters and begins with an overview of the relation between science and engineering followed by a discussion on the microscopic and macroscopic domains of matter the next chapter presents the basic relations involving mechanics electricity and magnetism light heat and related subjects which are most significant in the study of modern physical science subsequent chapters explore the nucleus and structure of an atom the concept of binding forces and binding energy the configuration of the system of the electrons surrounding the atomic nucleus physical and chemical properties of atoms and the structure of gases and solids the energy levels of groups of particles are also considered along with the schrödinger equation and electrical conduction through
