learning classifier systems are rule based systems that exploit evolutionary computation and reinforcement learning to solve difficult problems. They were introduced in 1978 by John H. Holland, the father of genetic algorithms, and since then they have been applied to domains as diverse as autonomous robotics, trading agents, and data mining. At the second international workshop on learning classifier systems (IWLCS-99) held July 13, 1999, in Orlando, Florida, active researchers reported on the then-current state of learning classifier system research and highlighted some of the most promising research directions. The most interesting contributions to the meeting are included in the book *Learning Classifier Systems: From Foundations to Applications*, published as Inai 1813 by Springer Verlag. The following year, the third international workshop on learning classifier systems (IWLCS-2000) held September 15–16 in Paris, gave participants the opportunity to discuss further advances in learning classifier systems. We have included in this volume revised and extended versions of thirteen of the papers presented at the workshop.

challenge can you find all the integers a b c satisfying  $2a^2 + 3b^2 + 5c^2 = 0$  looks simple and there are in fact a number of easy solutions but most of them turn out to be anything but obvious there are infinitely many possibilities and as any computer will tell you each of a b c will usually be large so the challenge remains find all integers a b c satisfying  $2a^2 + 3b^2 + 5c^2 = 0$  a major advance in number theory means this book can give an easy answer to this and countless similar questions the idea behind the approach is transforming a degree two equation in integer variables a b c into a plane curve defined by a polynomial working with the curve makes obtaining solutions far easier and the geometric solutions then get translated back into integers this method morphs hard problems into routine ones and typically requires no more than high school math the complete solution to  $2a^2 + 3b^2 + 5c^2 = 0$  is included in the book in addition to equations of degree two the book addresses degree three equations a branch of number theory that is today something of a cottage industry and these problems translate into elliptic curves this important part of the book includes many pictures along with the exposition making the material meaningful and easy to grasp this book will fit nicely into an introductory course on number theory in addition the many solved examples illustrations and exercises make self studying the book an option for students thus becoming a natural candidate for a capstone course
