today the silicon feedstock for photovoltaic cells comes from processes which were originally developed for the microelectronic industry it covers almost 90 of the photovoltaic market with mass production volume at least one order of magnitude larger than those devoted to microelectronics however it is hard to imagine that this kind of feedstock extremely pure but heavily penalized by its high energy cost could remain the only source of silicon for a photovoltaic market which is in continuous expansion and which has a cumulative growth rate in excess of 30 in the last few years even though reports suggest that the silicon share will slowly decrease in the next twenty years finding a way to manufacture a specific solar grade feedstock in large quantities at a low cost while maintaining the quality needed still remains a crucial issue thin film and quantum confinement based silicon cells might be a complementary solution advanced silicon materials for photovoltaic applications has been designed to describe the full potentialities of silicon as a multipurpose material and covers physical chemical and
