does the field of evolution differ from other sciences the author a reviewer for a major medical journal scrutinized hundreds of scientific references in evolutionary literature adopting the same standards used for studies submitted for medical publication the data show that there are two types of evolution microevolution and macroevolution with a clear boundary between them based upon the presence and absence of empirical evidence respectively the surprising results show that there is a universal disconnect between the data and the conclusions that claim to show the larger changes of macroevolution the author reveals patterns of deviations from standard scientific methods in these studies for the first time evolutionary data have been summarized to describe both what evolution can and cannot accomplish the author shows the reader how to recognize the different ways in which the evidence for microevolution within and between some species differs from the unsupported macroevolution of most species previous critiques of macroevolution have been debunked by advocates who have cited a multitude of scientific studies this book goes beyond previous critiques by directly addressing the data from these studies to see if they do in fact support macroevolution focused conclusions many expert counterarguments against this book s thesis are presented and examined in the context of scientific research to reassure the reader that the author has left no stone unturned in the macroevolution debate a theory is proposed as to why there may be no empirical evidence for macroevolution the book concludes with a section entitled what we see differently there the author shows the reader the differences in perspective between the evolutionist and macroevolution critic as they look at and interpret the very same set of data

this volume attempts to provide accessible accounts of these advances in developmental biology for the non expert together with contributions from hominid palaeontologists which aim to bring this developmental perspective to bear on interpretation of the skeletal record of human evolution this combined approach is as yet in its infancy but it is likely that it will impact significantly on palaeoanthropology and palaeontology in general

a valuable resource for the latest research on rodents highlighting links across palaeontology developmental biology functional morphology phylogenetics and biomechanics

the book is the most in depth account of the fossil skull anatomy and evolutionary significance of the 3.63 million year old early human species *Australopithecus afarensis* knowledge of this species is pivotal to understanding early human evolution because 1 the sample of fossil remains of *A. afarensis* is among the most extensive for any early human species and the majority of remains are of taxonomically informative skulls and teeth 2 the wealth of material makes *A. afarensis* an indispensable point of reference for the interpretation of other fossil discoveries 3 the species occupies a time period that is the focus of current research to determine when where and why the human lineage first diversified into separate contemporaneous lines of descent upon publication of this book this species will be among the most thoroughly documented extinct ancestors of humankind the main focus of the book its organizing principle is the first complete skull of an *A. afarensis* specimen number AL 444-2 at the Hadar site Ethiopia the home of the remarkably complete 3.18 million year old skeleton known as Lucy found at Hadar by third author D. Johanson in 1974 Lucy and other fossils from Hadar together with those from the site of Laetoli in Tanzania were controversially attributed to the then brand new species *A. afarensis* by Johanson T. White and Y. Coppens in 1978 however a complete skull which would have quickly resolved much of the early debate over the species proved elusive until second author Y. Rak's discovery of the 444 skull in 1992 the book details the comparative anatomy of the new skull and the cast of its brain analyzed by R. Holloway and M. Huan as well as of other

skull and dental finds recovered during the latest ongoing field work at hadar and analyzes the evolutionary significance of a afarensis in the context of other critically important discoveries of earliest humans made in recent years in essence it summarizes the state of knowledge about one of the central subjects of current paleoanthropological investigation

cognitive evolution provides an in depth exploration of the history and development of cognition from the beginning of life on earth to present day humans drawing together evolutionary and comparative research this book presents a unique perspective on the evolution of human cognition adopting an information processing perspective that is from inputs to outputs with all the mental processes in between boles provides a systematic overview of the evolutionary development of cognition and of its sensation movement and perception components the book is supported by long established evolutionary theories and backed up by a wealth of recent research from the growing field of cognitive evolution and cognitive neuroscience to provide a comprehensive text on the subject cognitive evolution is an essential read for advanced undergraduates and postgraduate students of cognitive and evolutionary psychology

this study focuses on the atlantic forest tree rats of the genus phyllomys rodentia echimyidae one of the most poorly understood mammal genera inhabiting the coastal rain forests brazil the most threatened lowland tropical forest in the world the author summarizes their distribution ecology and evolution using a combination of morphological and molecular analyses describes two new species and provides the first systematic revision of the genus which was originally described in 1839

this volume reviews the meaning of taxonomic statements and considers our present knowledge regarding the number and characteristics of species among living and extinct primates including man and his ancestors they also examine the relationship of behaviour changes and selection pressures in evolutionary sequences first published in 1964

although charles darwin predicted that his theory would give zest to metaphysics even he would be astonished at the variety of paths his theory has in fact taken this holds with regard to both gene darwinism a purified darwinian approach biologizing the social sciences and process darwinism found in the disciplines of psychology philosophy of science and economics although darwinism is often linked to highly confirmed biological theories some of its interpretations seem to profit from tautological claims as well where scientific reputation cloaks ideological usage this book discusses central tenets of darwinism historically as well as systematically for example the history of different darwinian paradigms the units of selection debate and the philosophical problem of induction as basis of metaphysical darwinism crucially the book addresses the darwinian claim that evolution is governed by an immutable and unrelentingly cruel law of natural selection

paradoxically darwins theory is a static non evolutionary theory of evolution the current book sketches the historical background and provides suggestions that may help to replace this approach by the idea of an evolution of evolutionary mechanisms see escher s drawing hands on the cover this view even suggests a tendency to overcome the blindness of the knowledge acquisition of primordial darwinian processes and allows for some freedom from external environments this book first develops a radically darwinian approach then criticises this approach from within even darwinism has a tendency to transcend itself although the book addresses several empirical issues it does not challenge particular findings instead it builds on many insights of darwinism and provides a proposal for interpreting known empirical evidence in a different light it should help pave the way for further developing an understanding of nature that transcends darwinian metaphysics publisher s description

the first edition of geometric morphometrics for biologists has been the primary resource for teaching modern geometric methods of shape analysis to biologists who have a stronger background in biology than in multivariate statistics and matrix algebra these geometric methods are appealing to biologists who approach the study of shape from a variety of perspectives from clinical to evolutionary because they incorporate the geometry of organisms throughout the data analysis the second edition of this book retains the emphasis on accessible explanations and the copious illustrations and examples of the first updating the treatment of both theory and practice the second edition represents the current state of the art and adds new examples and summarizes recent literature as well as provides an overview of new software and step by step guidance through details of carrying out the analyses contains updated coverage of methods especially for sampling complex curves and 3d forms and a new chapter on applications of geometric morphometrics to forensics offers a reorganization of chapters to streamline learning basic concepts presents detailed instructions for conducting analyses with freely available easy to use software provides numerous illustrations including graphical presentations of important

in the final decades of the twentieth century the advent of evolutionary developmental biology evo devo offered a revolutionary new perspective that transformed the classical neo darwinian gene centered study of evolution in the architecture of evolution marco tamborini demonstrates how this radical innovation was made possible by the largely forgotten study of morphology despite the key role morphology played in the development of evolutionary biology since the 1940s the architecture of organisms was excluded from the modern evolutionary synthesis and yet from the beginning of the twentieth century to the 1970s and 80s morphologists sought to understand how organisms were built and how organismal forms could be generated and controlled the generation of organic form was they believed essential to understanding the mechanisms of evolution tamborini explores how the development of evo devo and the recent organismal turn in biology involved not only the work of morphologists but those outside the biological community with whom they exchanged their data knowledge and practices together with architects and engineers they worked to establish a mathematical and theoretical basis for the study of organic form as a mode of construction developing and reinterpreting important notions that would play a central role in the development of evolutionary developmental biology in the late 1980s this book sheds light not only on the interdisciplinary basis for many of the key concepts in current developmental biology but also on contributions to the study of organic form outside the english speaking world
