the last two decades have witnessed an enormous growth with regard to applications of information theoretic framework in areas of physical biological engineering and even social sciences in particular growth has been spectacular in the field of information technology soft computing nonlinear systems and molecular biology
claude shannon in 1948 laid the foundation of the field of information theory in the context of communication theory it is in deed remarkable that his framework is as relevant today as was when he proposed it
shannon died on feb 24 2001
arun netravali observes as if assuming that inexpensive high speed processing would come to pass
shannon figured out the upper limits on communication rates first in telephone channels then in optical communications and now in wireless
shannon has had the utmost value in defining the engineering limits we face
shannon introduced the concept of entropy the notable feature of the entropy framework is that it enables quantification of uncertainty present in a system in many realistic situations one is confronted only with partial or incomplete information in the form of moment or bounds on these values etc and it is then required to construct a probabilistic model from this partial information in such situations the principle of maximum entropy provides a rational basis for constructing a probabilistic model it is thus necessary and important to keep track of advances in the applications of maximum entropy principle to ever expanding areas of knowledge
