this volume is a collection of the papers given at the workshop on fracture scaling held at the university of maryland usa 10 12 june 1999 under the sponsorship of the office of naval research

arlington va usa these papers can be grouped under five major themes micromechanical analysis size effects in fiber composites scaling and heterogeneity computational aspects and nonlocal or gradient models size effects in concrete ice and soils this workshop is the result of a significant research effort supported by the office of naval research into the problems of scaling of fracture in fiber composites and generally into the problems of scaling in solid mechanics these problems which are of interest for many materials especially all quasibrittle materials share similar characteristics thus progress in the understanding of scaling problems for one material may help progress for another material this makes it clear that a dialogue between researchers in various fields of mechanics is highly desirable and should be promoted in view of this this volume should be of interest to researchers and advanced graduate students in materials science solid mechanics and civil engineering

this handbook contains a set of articles introducing the modeling and simulation of materials from the standpoint of basic methods and studies the intent is to provide a compendium that is foundational to an emerging eld of computational research a new discipline that may now be called compu tional materials this area has become suf ciently diverse that any attempt to cover all the pertinent topics would be futile even with a limited scope the present undertaking has required the dedicated efforts of 13 subject editors to set the scope of nine chapters solicit authors and collect the manuscripts the contributors were asked to target students and non specialists as the primary audience to provide an accessible entry into the eld and to offer references for further reading with no precedents to follow the editors and authors were only guided by a common goal to produce a volume that would set a standard toward de ning the broad community and stimulating its growth the idea of a reference work on materials modeling surfaced in conver tions with peter bin eld then the reference works editor at kluwer academic publishers in the spring of 1999 the rationale at the time already seemed quite clear the eld of computational materials research was t ing off powerful computer capabilities were becoming increasingly available and many sectors of the scienti c community were getting involved in the enterprise

dynamics of plate tectonics and mantle convection written by specialists in the field gathers state of the art perspectives on the dynamics of plate tectonics and mantle convection plate tectonics is a unifying theory of solid earth sciences in its initial form it was a kinematic theory that described how the planet s surface is fragmented into several rigid lithospheric plates that move in relation to each other over the less viscous asthenosphere plate tectonics soon evolved to describe the forces that drive and resist plate movements the earth sciences community is now developing a new perspective that looks at plate tectonics and mantle convection as part of a single system why does our planet have plate tectonics and how does it work how does mantle convection drive the supercontinent cycle how have tectono convective modes evolved over the earth s history how did they shape the planet and impact life do other planets have mantle convection and tectonics these are some of the fascinating questions explored in this book this book started with a challenge from the editor to the authors to provide perspectives from their vantage point and open the curtain to the endeavors and stories behind the science provides diverse perspectives from different experts around the world in plate tectonics and geodynamics includes the most up to date knowledge on

plate tectonics and mantle convection sets the scene for the developments and challenges likely to be faced by researchers in the future of geodynamics

this textbook presents a compilation of class tested materials and the results of research on a range of topics in into one comprehensive volume for readers engaged in the materials science and engineering aspects of phase transformation in metals accordingly this is a suitable textbook for undergraduate and graduate students in the fields of mechanical engineering materials science metallurgical engineering and related disciplines the book incorporates two dimensional materials crystal defects mass transport thermodynamics of phase solidification heat transfer solidification and phase diagrams related to nucleation particle phases and explains solid state phase transformation mechanical behaviour and fracture toughness non destructive methods physical and optical properties of solids and electrochemical corrosion it also stands as an excellent reference treatise for practicing and consulting engineers moreover the book is appropriate for graduate level coursework covering advanced subjects including quantum mechanics two dimensional materials fracture mechanics non destructive methods for evaluating structural integrity and advanced analytical techniques in some appendices

this volume presents contributions by a galaxy of eminent scientists and technologists from the world over in broad spectrum of areas in materials science providing a global perspective on complex issues of current concern and the direction of research in these areas

this book reflects quite clearly the expansion of the field of textures as well as the rapid growth of the texture community during the recent years the scope of this field has been expanded to virtually all crystalline and even partly crystalline materials including intermetallic compounds ceramics polymers as well as multiphase composites and even fullerenes

this volume gathers a variety of applications for remote sensing of vegetation health vh and concretely shows how this information can be used in service of ending hunger and of ensuring future food security in this book s ten chapters dr felix kogan one of the most prolific scientists in this sphere shows how a new vh method designed from operational environmental satellite data can be used to provide advanced predictions of agricultural losses helping to enhance food security and reducing the number of hungry people topics covered include the scientific basis of the vh method drought monitoring prediction of short term agricultural yield and crop insurance and impacts of long term climate variability and change on food security a short discussion on vh for human health related topics such as detection and prediction of malaria and fire risk is included as well

these are the proceedings of an international conference held in june 2007 on santorini island greece on the occasion of the 15th anniversary of the discovery of the first extrasolar planets around the
