plant disease epidemiologists have a strong scientific tradition in studying climate pathogen disease relationships biodiversity is also of global concern the decline of global biodiversity that is currently taking place has been referred to as the sixth great extinction process our planet has experienced during its history but this time it is man made generations of plant pathologists and especially of plant disease epidemiologists have been dealing with biodiversity it is from this diversity that presumably the most potent instrument for disease management has been developed by plant pathologists host plant resistance host plant diversity and

the disease resistance genes it harbours can be deployed over time and space according to epidemiological principles sustainable production and protection systems also need to be devised which could exploit scarcer resources sparingly and if possible enhance the resource base plant disease epidemiologists alone cannot provide answers to such questions but certainly could significantly contribute to these new strategies this book provides an overview of some of the latest research in plant disease epidemiology from researchers at the cutting edge of this important discipline

providing a practical comprehensive and up to date overview of the use of spatial statistics in epidemiology this book examines spatial analytical methods in conjunction with gis and remotely sensed data to provide insights into the patterns and processes that underlie disease transmission

offers an in depth report on advanced statistical tools for public health disease surveillance which is the result of a prestigious world health organisation who and eu biomed programme initiative traditionally the role of public health disease surveillance has been to identify and evaluate morbidity and mortality but increasingly more sophisticated methods are being applied as the authorities extend their studies to include control and prevention of disease this book brings together leading experts to discuss complex methodologies for the statistical evaluation of disease mapping and risk assessment it includes a broad variety of statistical techniques and where appropriate examples are included on topical issues such as the analysis of putative health hazards for easy reference the text is presented in five distinct sections each with an introductory review disease mapping clustering of diseases ecological analysis risk assessment for putative sources of hazard public health applications and case studies representative of the most pertinent issues within disease surveillance and mapping this book will provide an accessible overview for statisticians and epidemiologists

cardiovascular disease cvd is the leading cause of death in the united states and costs the u s health care system an estimated 531 billion in direct and indirect costs because of the high incidence and cost of this disease clinical practice guidelines target primary prevention and recommend that providers evaluate patients for cardiac risk factors that may warrant medical treatment however previous research has shown that providers do not accurately estimate the risk of cvd events on their own a number of multivariate risk prediction equations derived from large prospective cohort studies or randomized trials have been developed to estimate cvd risk in time intervals ranging from 4 to 12 years in order to make them more usable to busy clinicians many of these risk models only require information from a patient s medical history and easily available laboratory tests and have been adapted

for interpretation through simplified charts or tables in paper or computer based formats the most commonly used cvd risk prediction models in the united states are those based upon the framingham cohort a large prospective cohort of u s men and women aged 30 to 74 years these models have been subsequently validated in multiple diverse populations however controversy remains regarding which variables are the most important for risk prediction which outcomes are the most generalizable across populations and whether remodeling or recalibration needs to be addressed in populations other than the source cohort a number of studies showing that patients with diabetes had significantly elevated risk for cardiovascular outcomes prompted the adult treatment panel iii atp iii guidelines which include a risk calculator that excludes patients with diabetes and direct clinicians to consider those patients as already having cvd for the purposes of medical management however other studies have questioned this assertion both from risk modeling and disease management standpoints 29 in addition there is a growing literature that suggests that patients with diabetes themselves are a heterogeneous group of patients who require diabetes specific risk factors to adequately characterize their cardiovascular risk the aim of this systematic review was to summarize the current state of cvd risk models with a focus on the u s patient population in addition performance of each of the available models in populations other than the source cohort was assessed as well as a summarization of which models use which risk factors and the impact that recalibration and reclassification has had in the last few decades on these models finally we sought evidence related to which models are best suited for predicting cardiovascular risk among patients with diabetes and whether treating diabetes as an outcome equivalent is appropriate the key questions for this report were kq1 do any of the currently available tools for the prediction of cardiovascular risk in a north american population offer clear advantages in discriminatory power over the others in predicting incident coronary heart disease chd cerebrovascular stroke stratified by thrombotic or hemorrhagic type or a combination of these two kq2a do tools that treat diabetes as a chd outcome equivalent have different performance characteristics

than those that use diabetes as an independent risk factor for those outcomes kq2b is the appropriateness of using diabetes as a coronary risk equivalent modified by the number of other cardiac risk factors that the individual has

leading the way in this field the encyclopedia of quantitative risk analysis and assessment is the first publication to offer a modern comprehensive and in depth resource to the huge variety of disciplines involved a truly international work its coverage ranges across risk issues pertinent to life scientists engineers policy makers healthcare professionals the finance industry the military and practising statisticians drawing on the expertise of world renowned authors and editors in this field this title provides up to date material on drug safety investment theory public policy applications transportation safety public perception of risk epidemiological risk national defence and security critical infrastructure and program management this major publication is easily accessible for all those involved in the field of risk assessment and analysis for ease of use it is available in print and online
