geographic information systems represent an exciting and rapidly expanding technology via which spatial data may be captured stored retrieved displayed manipulated and analysed applications of this technology include detailed inventories of land use parcels spatial patterns of disease geodemographics environmental management and macroscale inventories of global resources the impetus for this book is the relative lack of research into the integration of spatial analysis and gis and the potential benefits in developing such an integration from a gis perspective there is an increasing demand for systems that do something

other than display and organize data from a spatial analytical perspective there are advantages to linking statistical methods and mathematical models to the database and display capabilities of a gis although the gis may not be absolutely necessary for spatial analysis it can facilitate such an analysis and moreover provide insights that might otherwise have been missed the contributions to the book tell us where we are and where we ought to be going it suggests that the integration of spatial analysis and gis will stimulate interest in quantitative spatial science particularly exploratory and visual types of analysis and represents a unique statement of the state of the art issues in integration and interface
